687 Japan
Complete User Guide

Plan your trip. Control your budget. Adapt while you travel.

687 Japan home screen (example).

About this guide

This mobile-first manual explains the complete 687 Japan workflow: trip setup, bookings, itinerary, Nearby, Intelligent Day, budget, prevention, alerts, live Signals, Rescue, navigation, translation and travel tools. Screenshots contain example data and are for guidance only.

31. Quick reference **72**

1. What 687 Japan does

687 Japan is designed to stay useful throughout the entire trip: before departure, while moving between cities, during the day, and when plans change.

- **Plan:** dates, travelers, budget, flights, accommodation, rental car and multi-city routing.
- **Organize:** itinerary, daily expenses, travel documents and packing.
- **Live:** Nearby, Today, NOW and Smart Route use the current travel context.
- **Adapt:** Budget, Prevent and Guardian help the day react to money, weather and route conditions.
- **Connect:** 687 Pulse powers Live Signals when the backend is reachable.
- **Rescue:** quick actions help when something has already gone wrong.

Important
External providers remain responsible for their own prices, availability, bookings, terms and navigation. 687 Japan helps organize and pass trip context; it does not replace the provider or official emergency services.

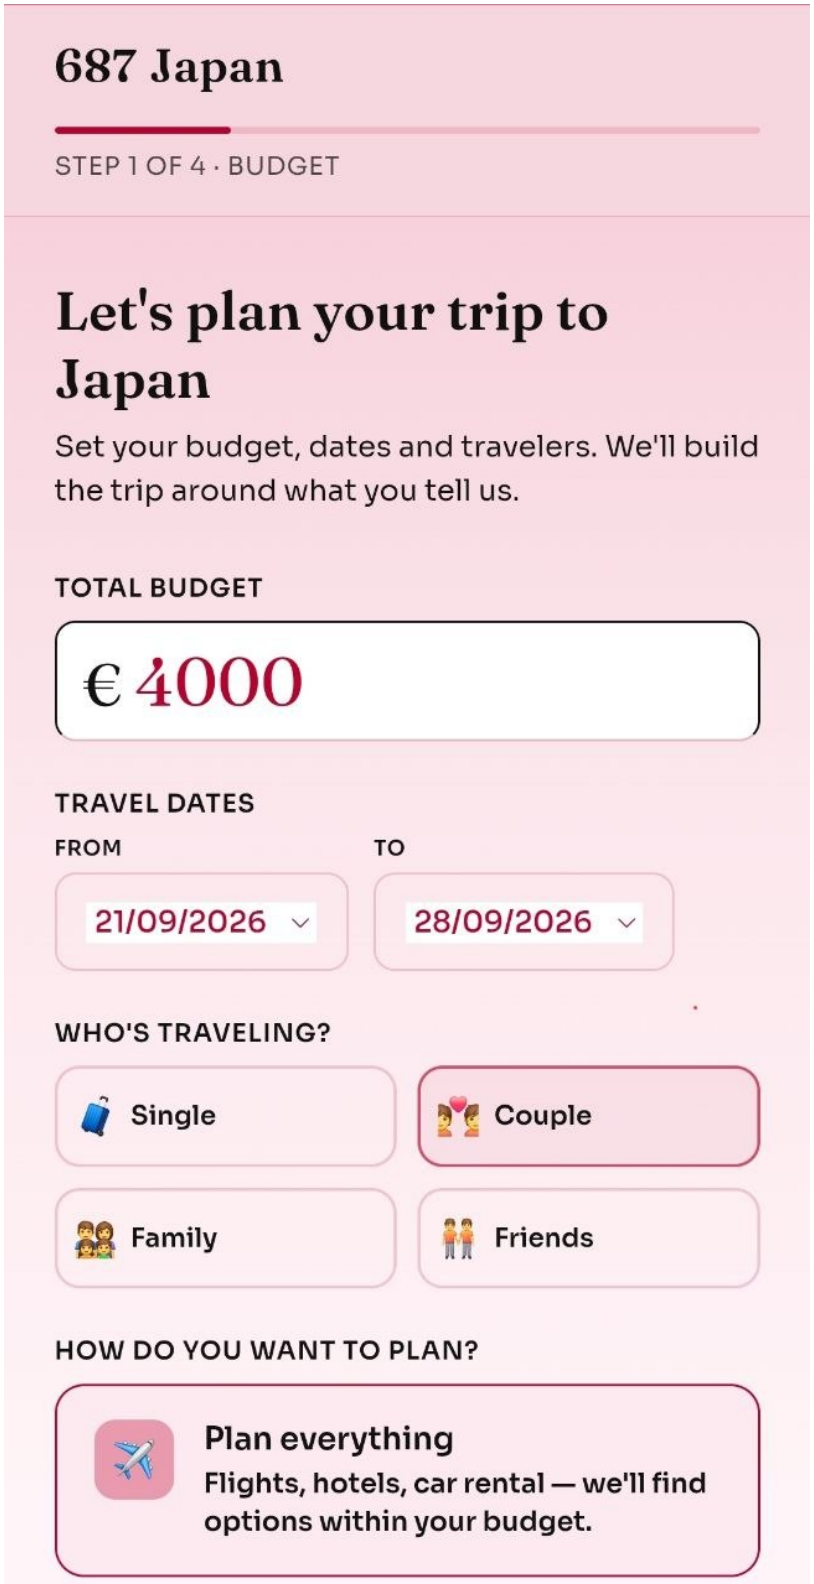

2. Start a new trip

The trip setup creates the data used by the rest of the app. Enter the information carefully, because budget intelligence, itinerary dates and booking shortcuts depend on it.

Step 1 - Budget, dates and travelers

- **Total budget:** your overall trip budget.
- **Travel dates:** arrival and departure window.
- **Travelers:** Single, Couple, Family or Friends.
- **Planning mode:** choose how much of the trip you want the app to help organize.

> **Best practice**
> Use a realistic total budget from the beginning. The app will later subtract locked costs and logged expenses, then calculate daily targets and a safe-to-spend amount.

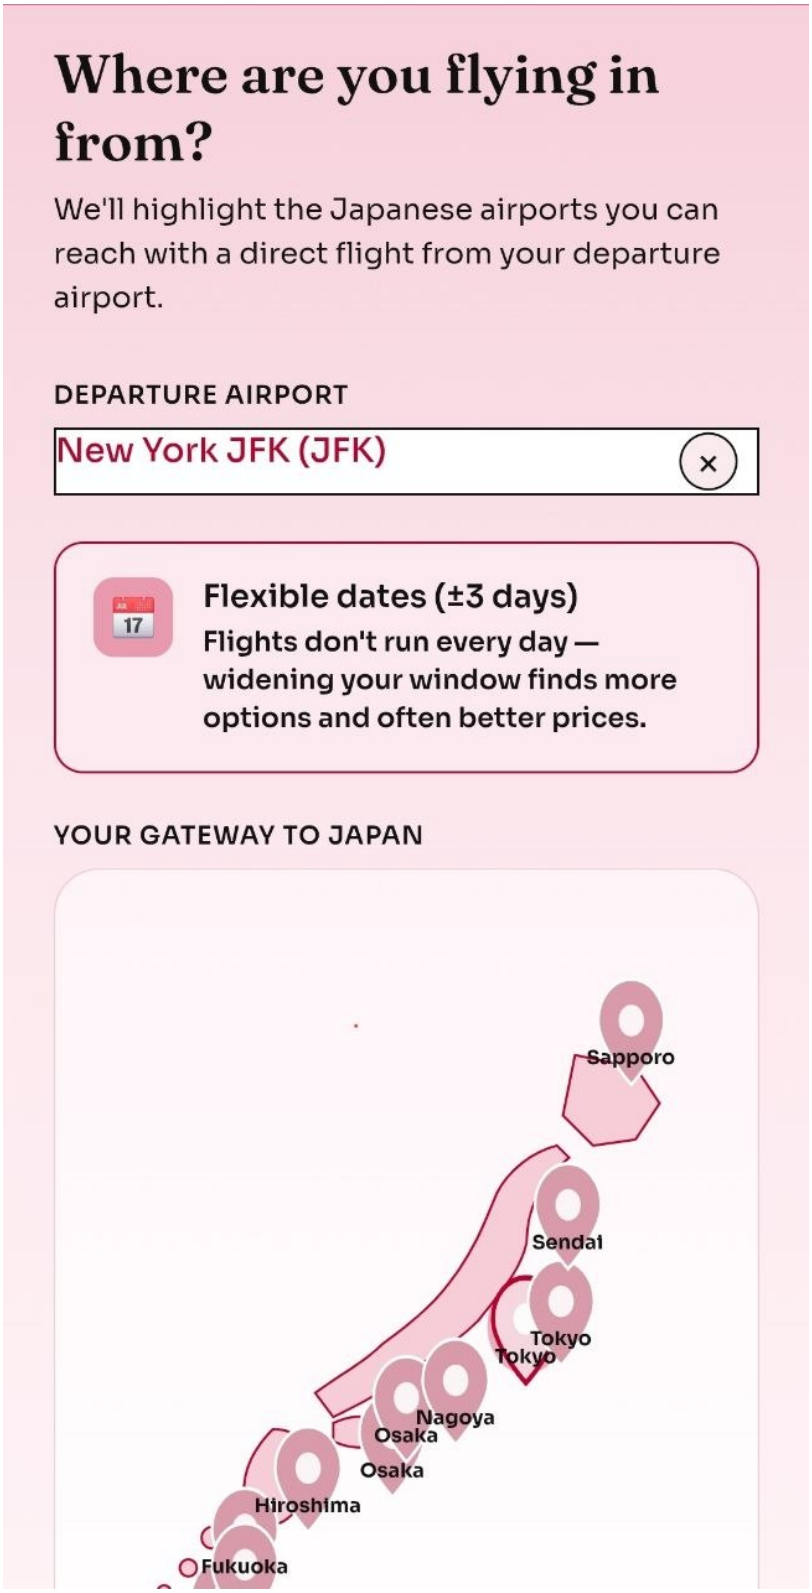

Trip setup: budget, dates and traveler type.

3. Flights to Japan

Choose the departure airport, optionally use flexible dates, and let the app identify Japanese gateway airports that match the available route data.

Departure airport and direct-flight gateway

- Enter or select your departure airport.
- Flexible dates (+/- 3 days) can widen the search window.
- The Japan map highlights candidate arrival airports.
- Tap a direct-flight airport to continue when one is available.

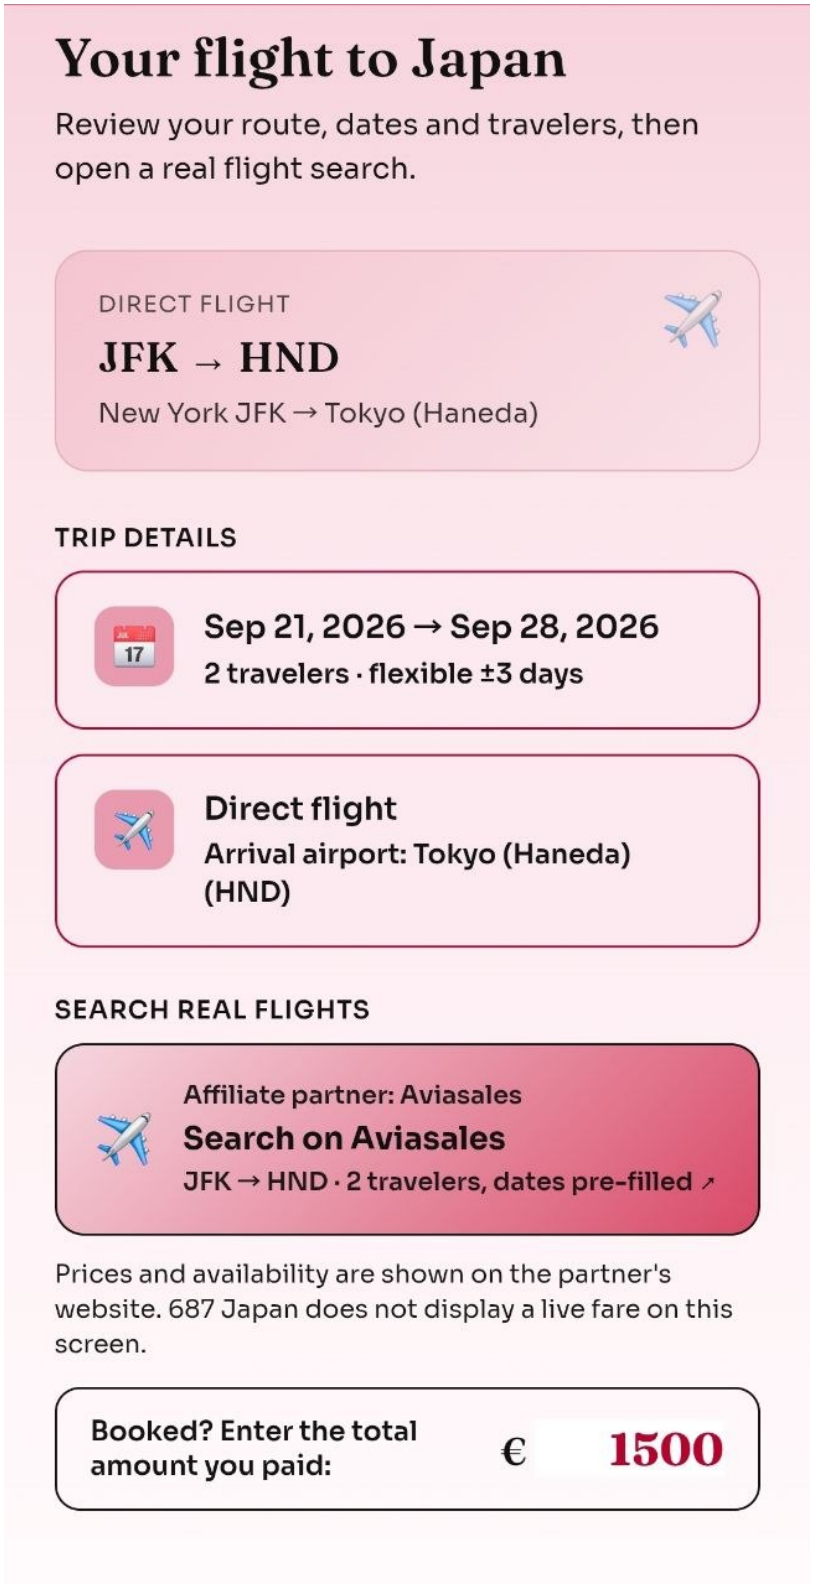

Example: departure airport and Japan gateway map.

Flight review and real search

The flight review screen shows the route, dates, travelers and arrival airport before opening a real flight search. The app does not invent a live fare on this screen.

- **Search on Aviasales:** opens the external flight provider.
- **Booked? Enter the total amount you paid:** record the real booking amount so it is included in the trip budget.

> **Budget rule**
> Always enter the amount you actually paid after booking. That produces a much more reliable remaining-budget calculation.

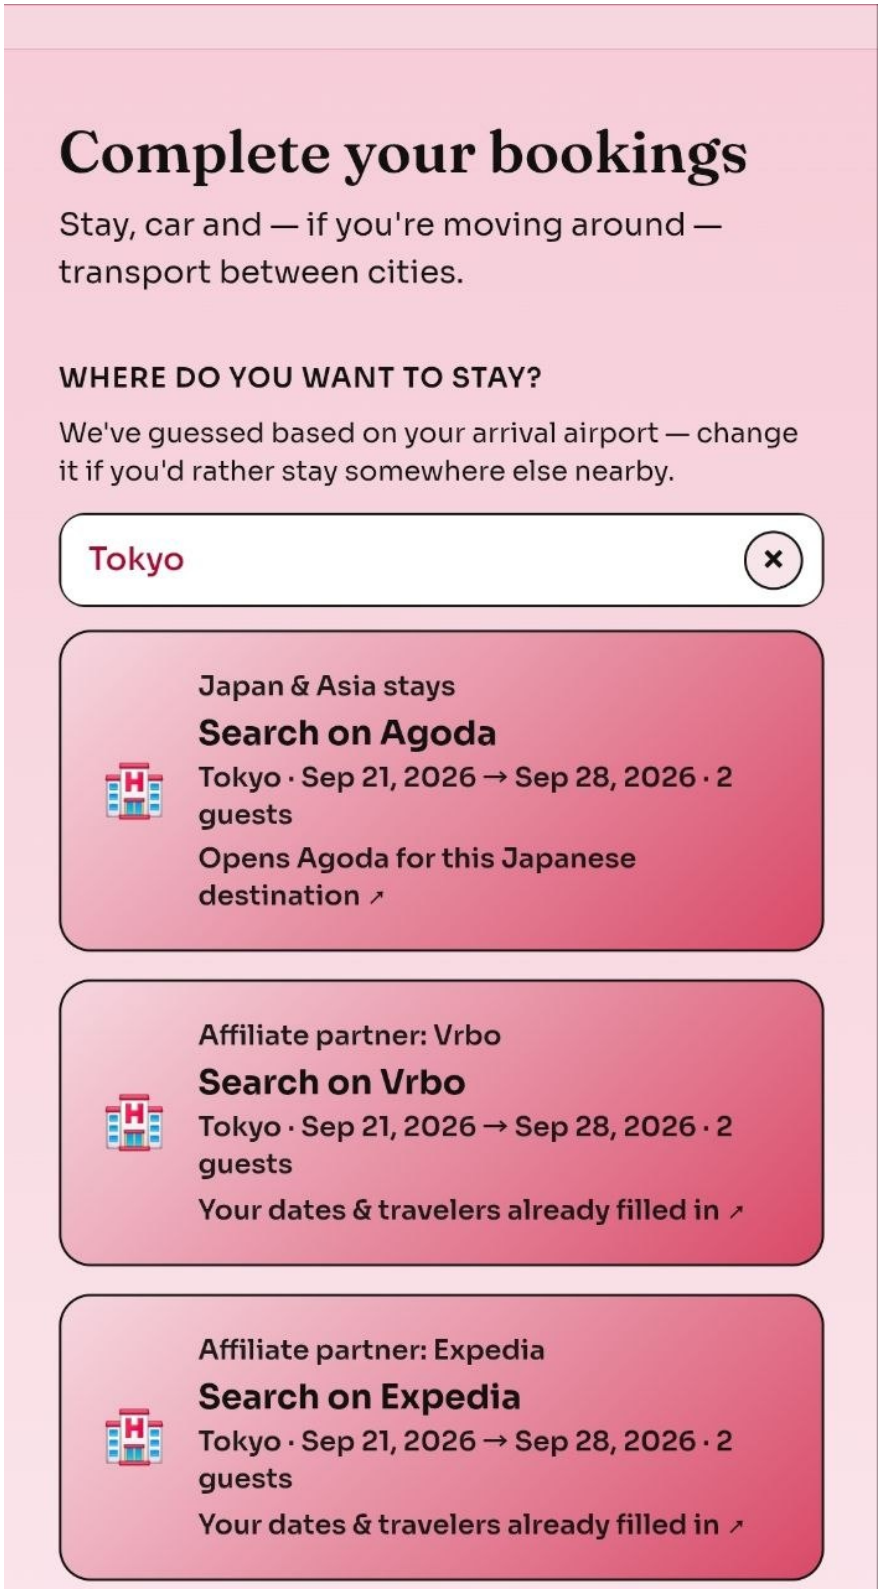

Flight review with provider search and booked-cost entry.

4. Accommodation and rental car

The booking stage helps you open accommodation partners, record the accommodation you actually booked, and include a rental car when needed.

Accommodation

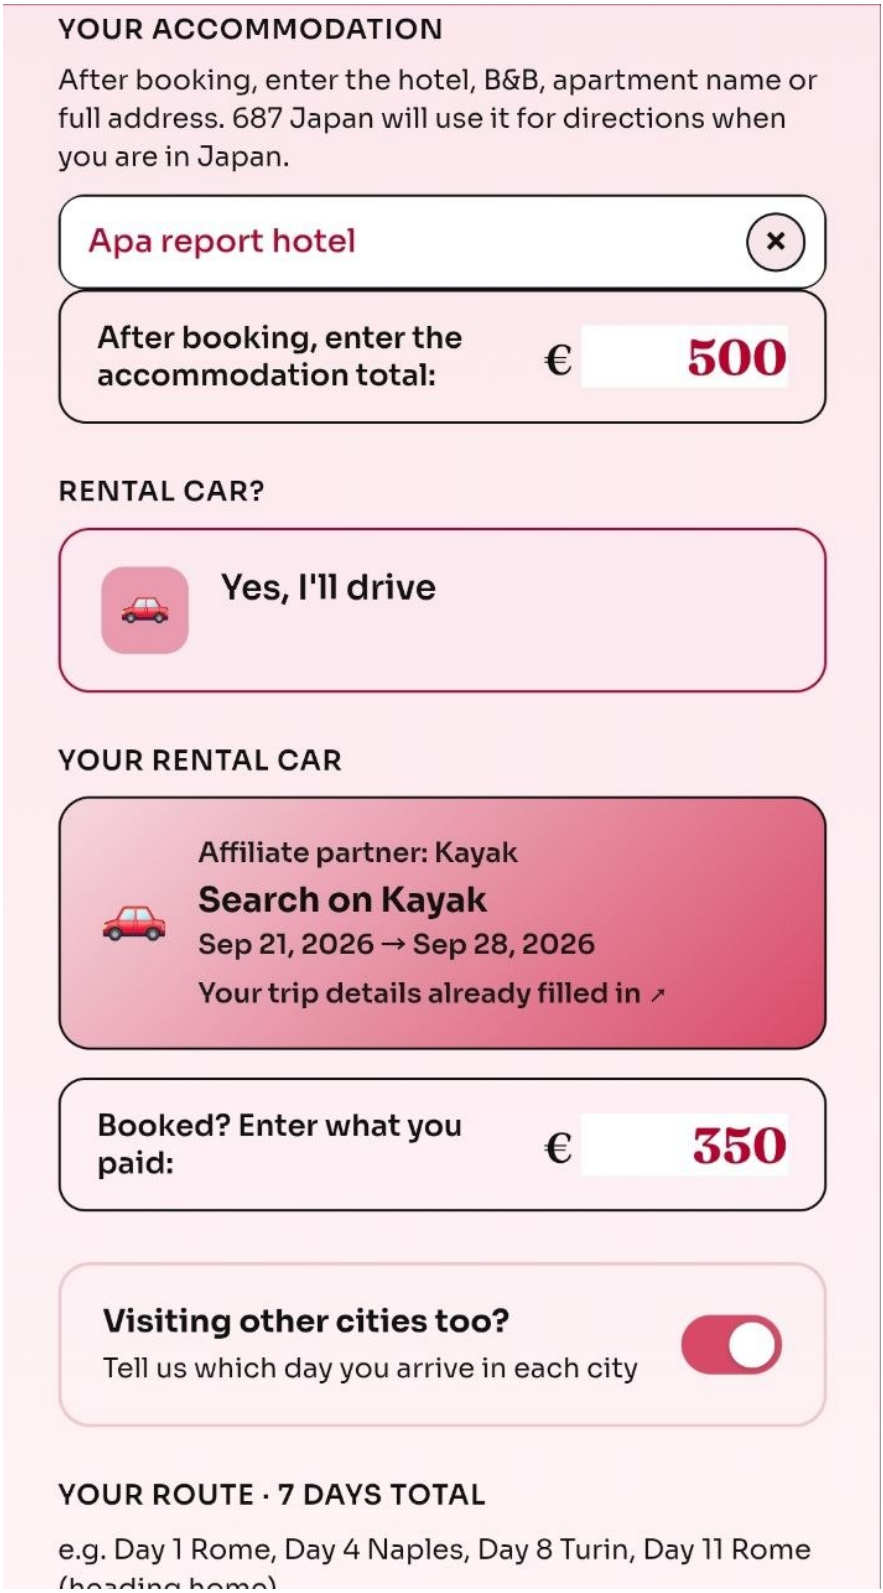

- Confirm or change the destination city.
- Open supported external partners such as Agoda, Vrbo or Expedia.
- After booking, enter the accommodation name or full address.
- Enter the total amount paid so the budget reflects the real stay cost.

Accommodation provider shortcuts with trip context.

Rental car

- Enable **Yes, I'll drive** when a rental car is part of the trip.
- Open the external car-rental provider.
- After booking, enter the amount paid.
- The Drive section later builds the inter-city driving calendar from your route.

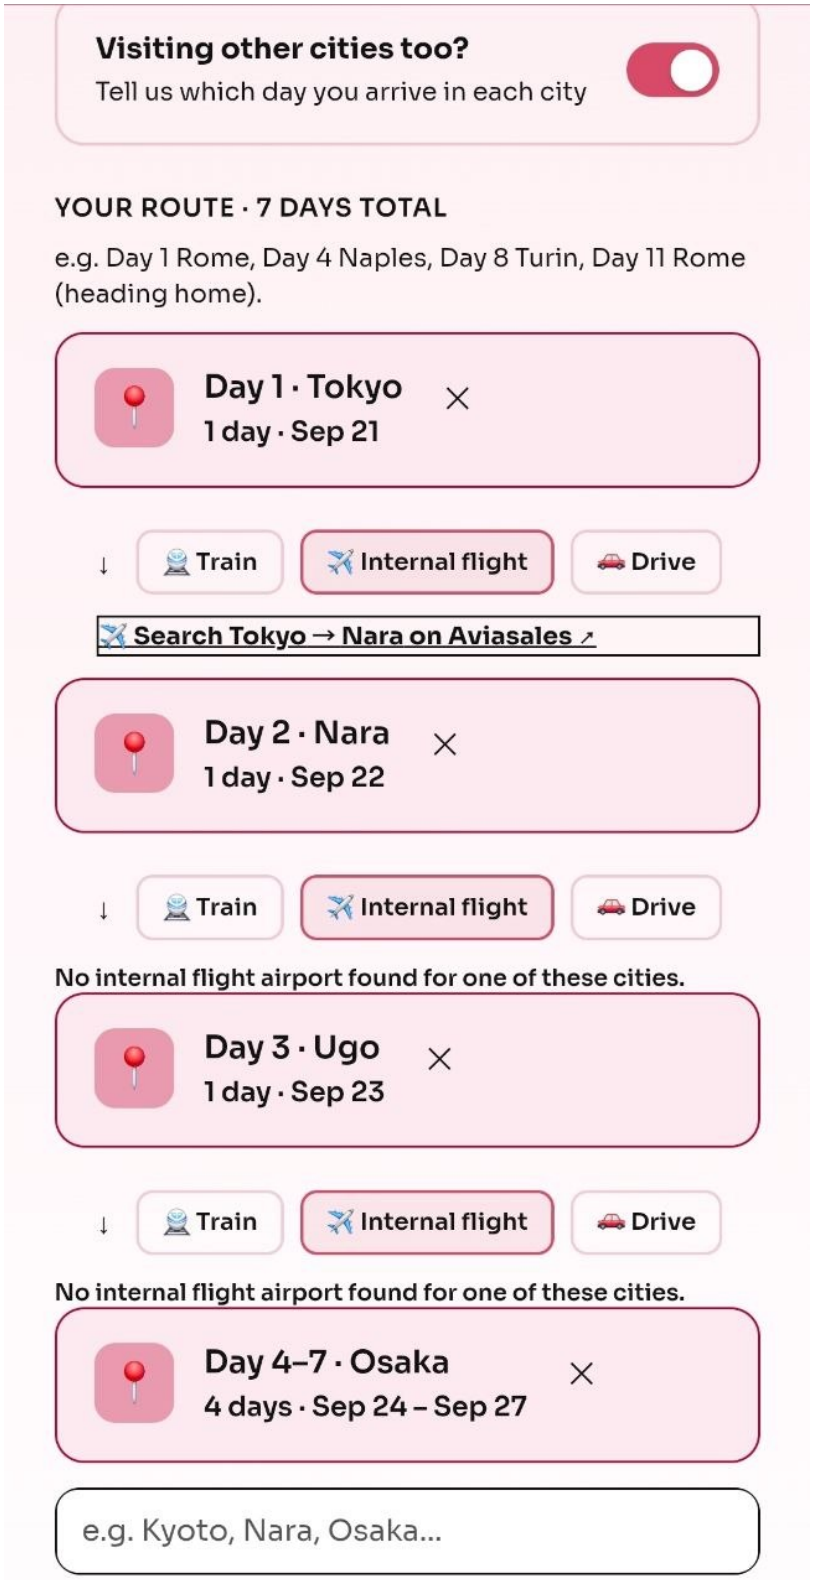

Accommodation details, rental car and booked costs.

5. Multi-city route

Use **Visiting other cities too?** to build a trip across several Japanese destinations. Each city is associated with a travel day or date range.

- Add each city in the order you plan to visit it.
- For transfers, the app can expose **Train**, **Internal flight** and **Drive** options.
- Internal-flight availability depends on practical airport mapping. Some city pairs may correctly show that no suitable airport was found.
- Use the provider link when a real transport search is available.

Example multi-city route with transfer choices.

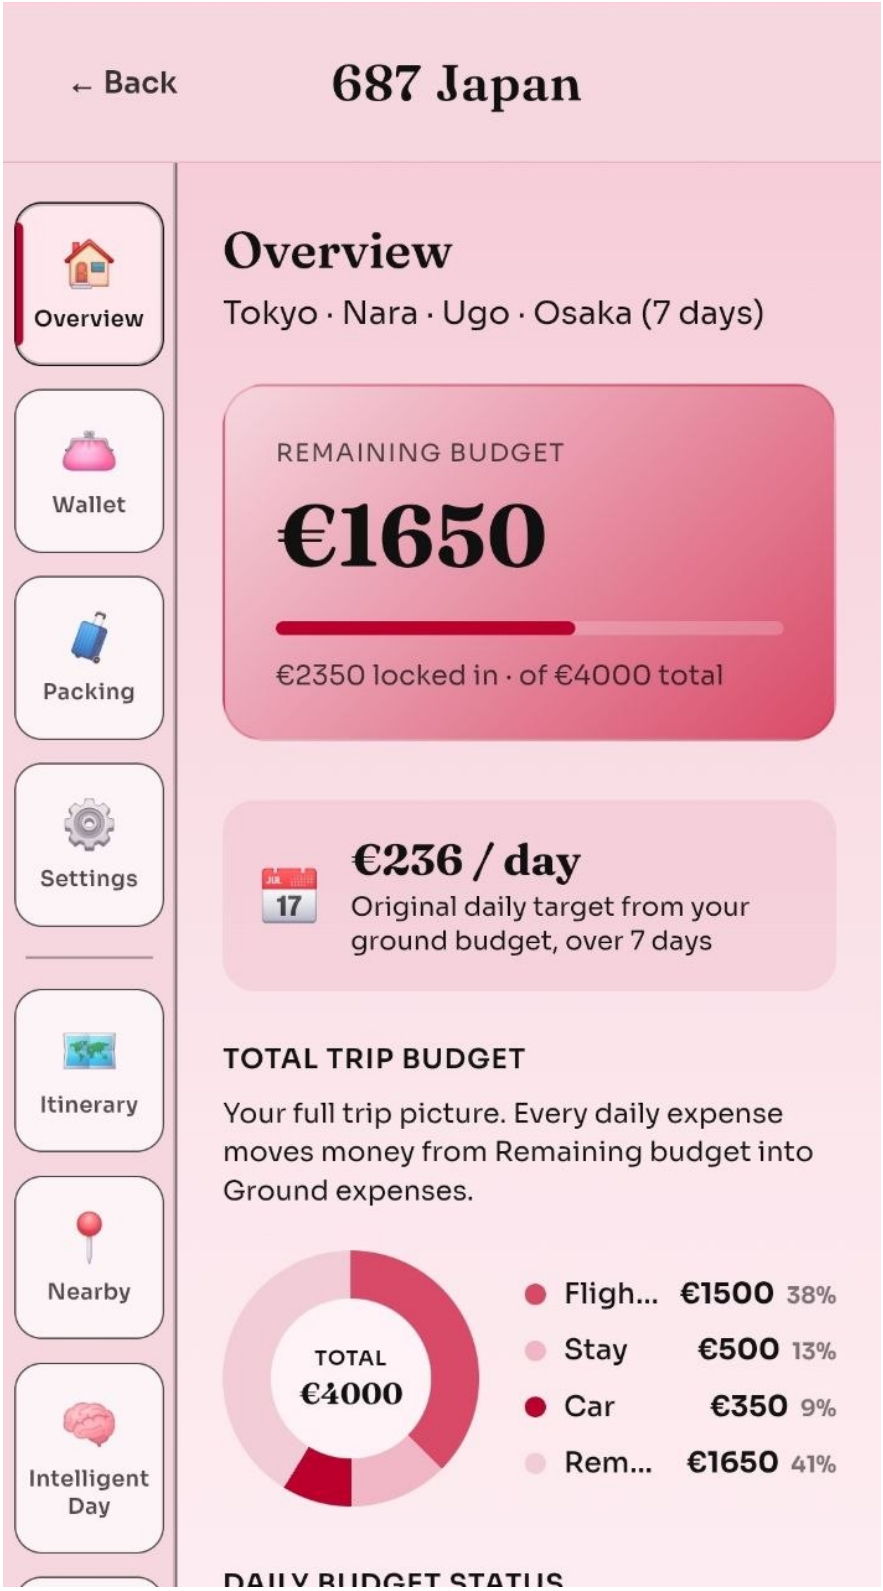

6. Main dashboard

After setup, the main dashboard becomes the operating center for the trip. The side menu gives access to Overview, Wallet, Packing, Settings, Itinerary, Nearby, Intelligent Day, Drive, Translate and Tools.

Overview

Overview summarizes the trip budget. It shows what is already locked in, what remains, and the original daily target.

- **Remaining budget:** money left after locked costs.
- **Locked in:** recorded flight, stay, car and other committed costs.
- **Daily target:** original ground-budget pace across the trip.
- **Trip chart:** visual breakdown of major cost categories.

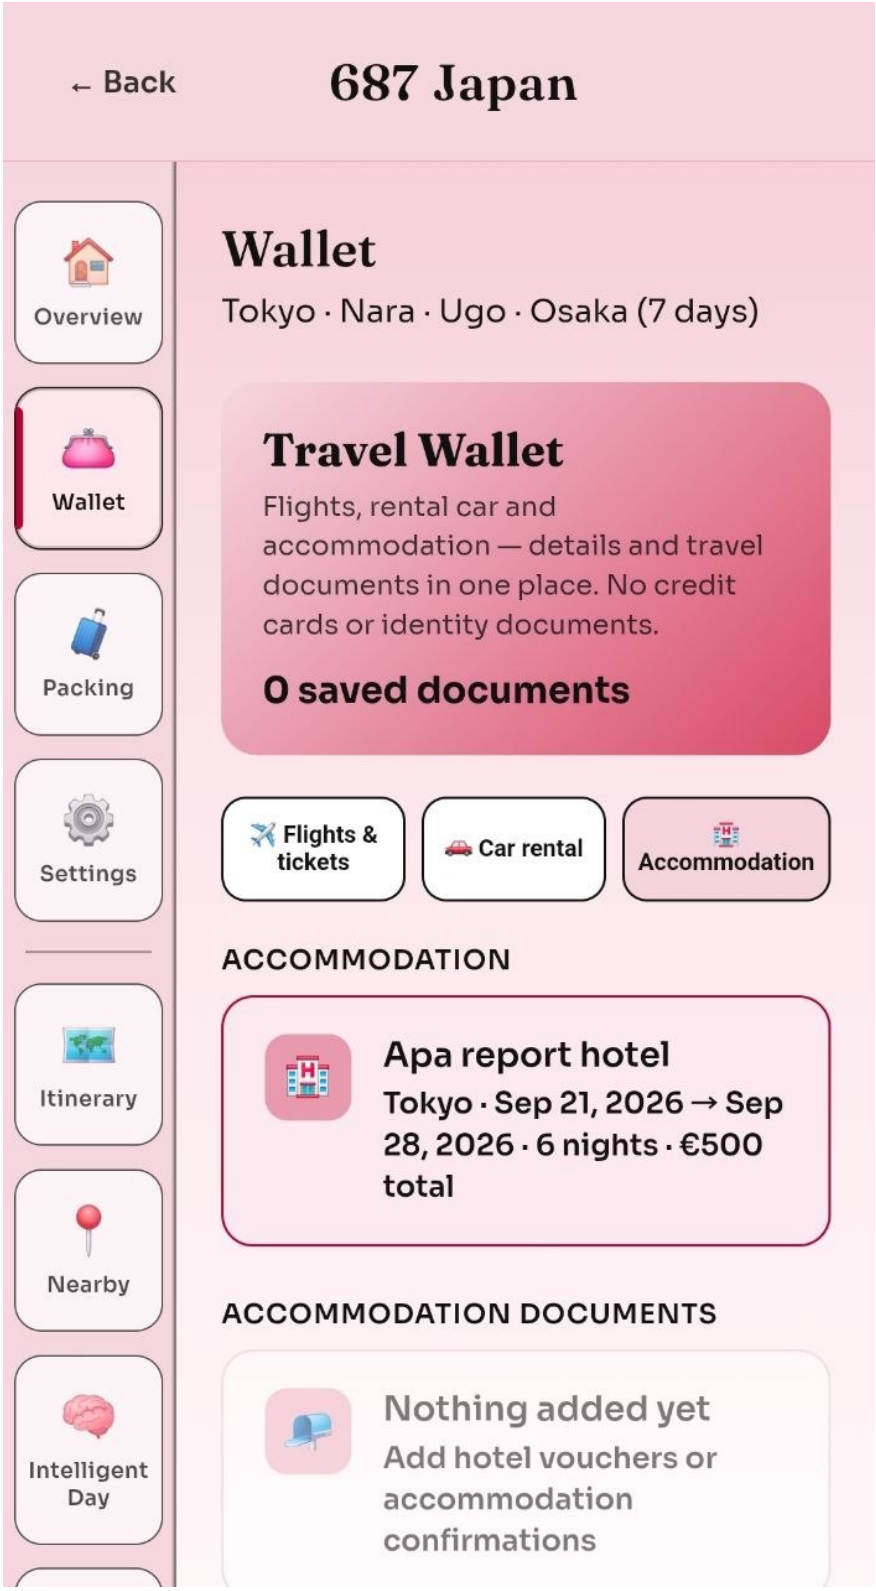

Overview: remaining budget, daily target and trip allocation.

7. Wallet

Wallet keeps travel details and booking documents together. It is not a payment-card wallet.

- Flights and tickets
- Car rental
- Accommodation
- Booking confirmations and vouchers

> **Privacy reminder**
> Do not treat Wallet as a place for payment-card details or identity documents. The in-app copy explicitly separates it from those sensitive items.

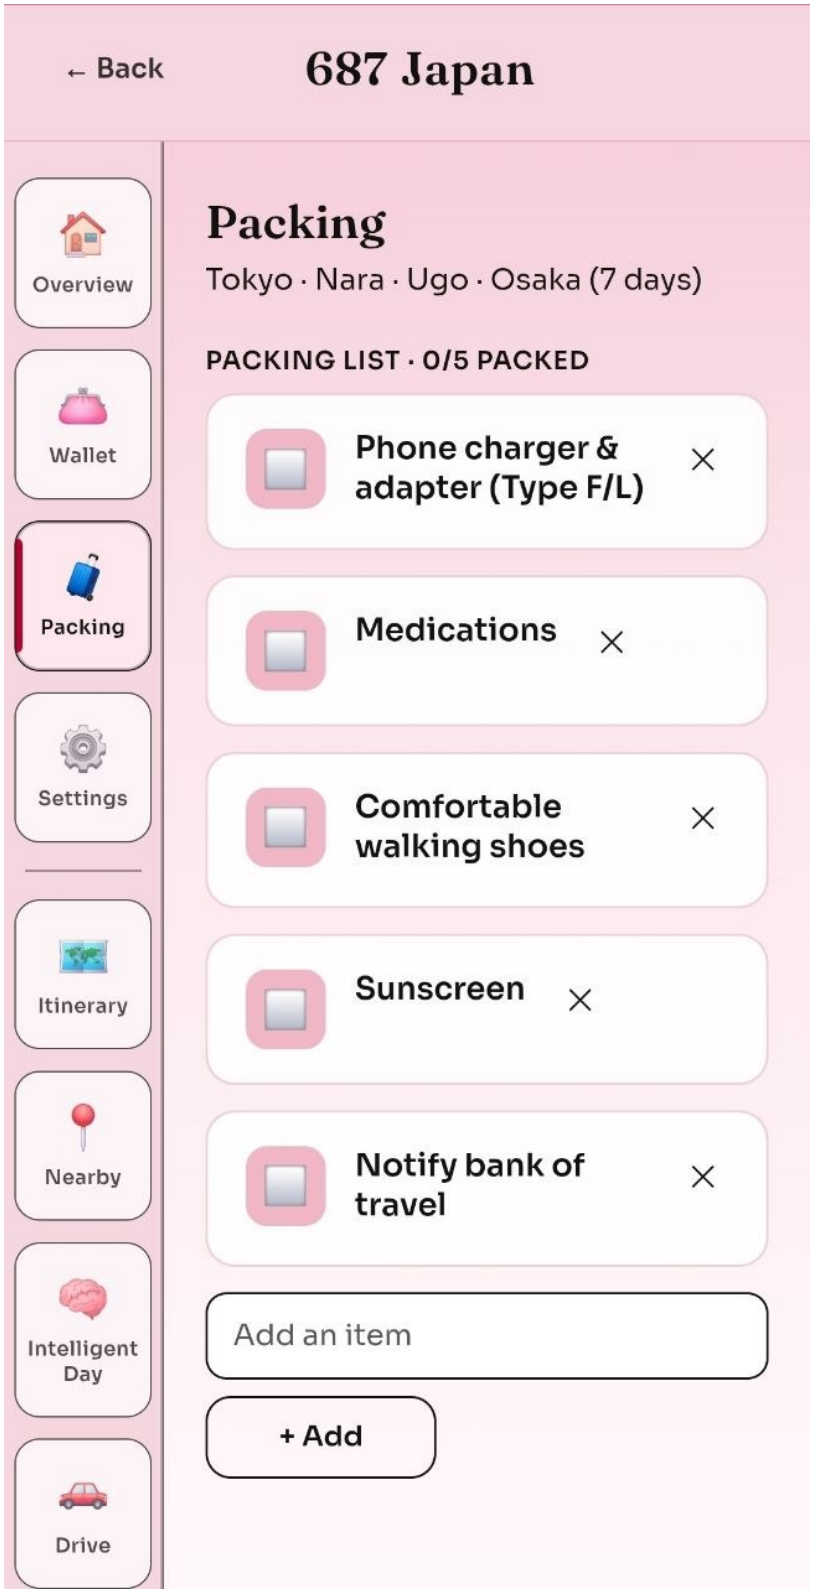

Wallet: booked accommodation and document area.

8. Packing

Packing is a checklist for preparing the trip. Tick completed items, remove items you do not need, and add your own.

- Tap the checkbox to mark an item packed.
- Use the X to remove an item.
- Type a custom item and tap **+ Add**.

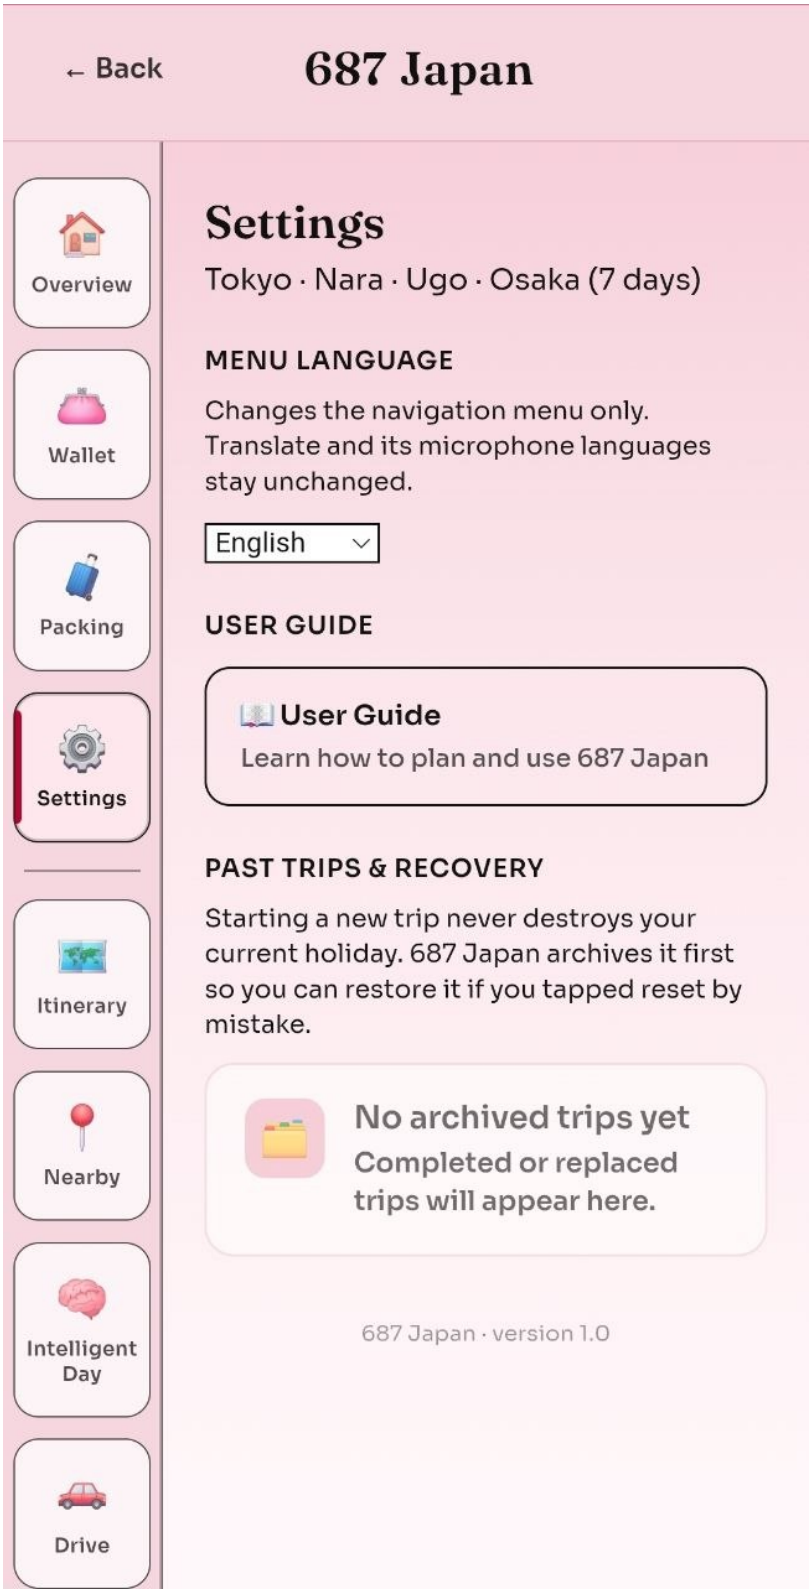

Packing checklist with custom-item entry.

9. Settings, language and trip recovery

Settings controls the navigation-menu language and provides the User Guide and past-trip recovery area.

- **Menu language:** changes navigation labels only. Translate and microphone language choices remain independent.
- **User Guide:** opens the in-app guide.
- **Past Trips & Recovery:** archived/replaced trips can appear here for recovery.

> **Single visual theme**
> The final build exposes one visual theme, so there is no theme selector to manage.

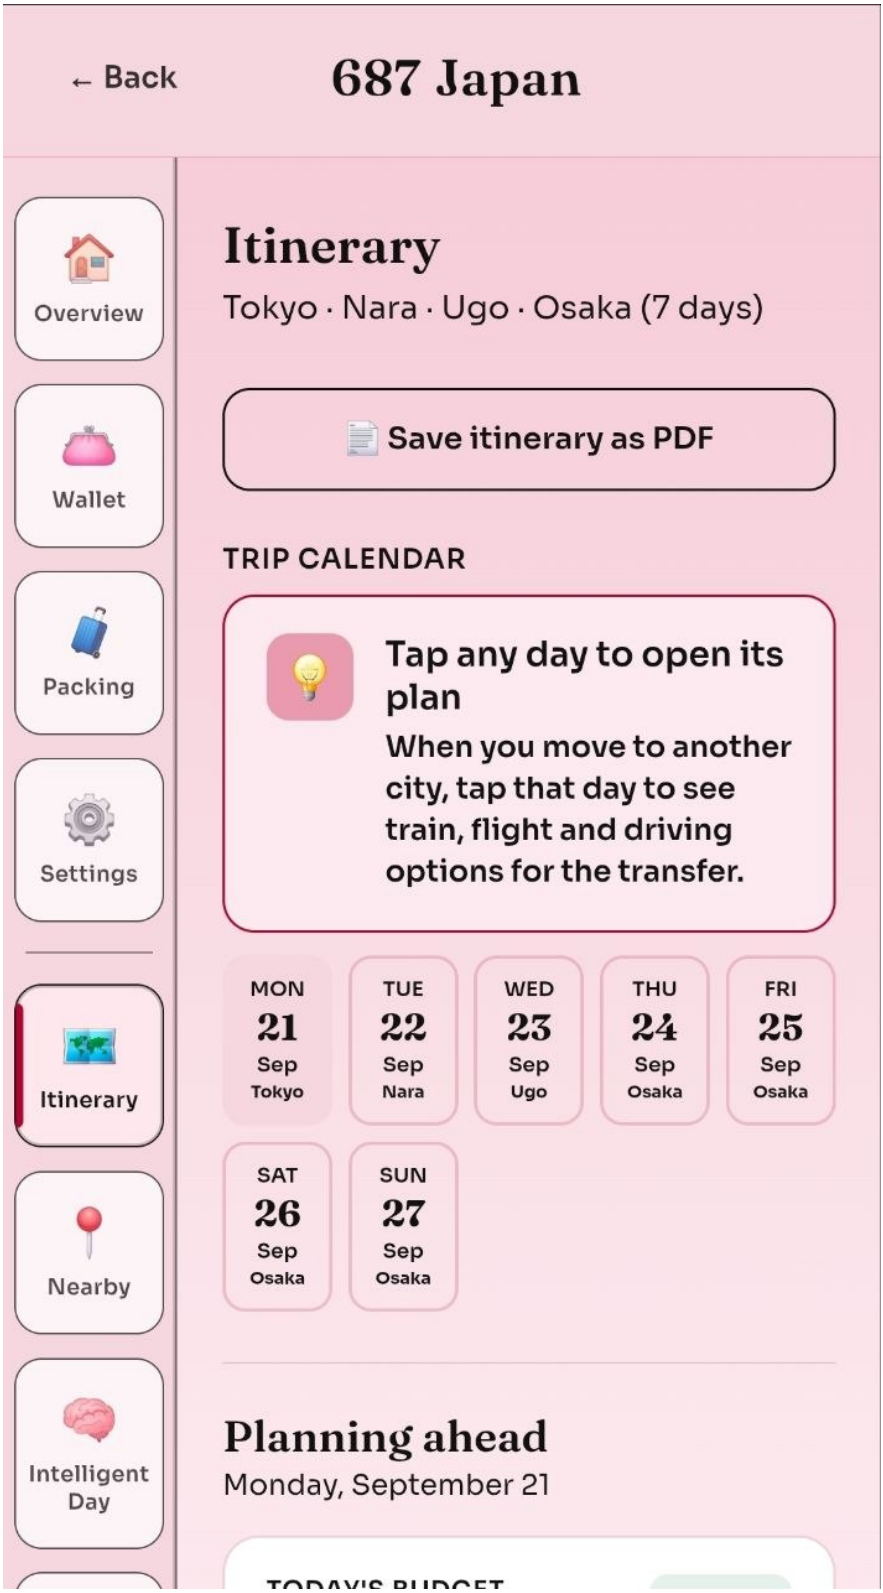

Settings: menu language, User Guide and past-trip recovery.

10. Itinerary

Itinerary is the day-by-day plan. It combines the trip calendar, daily budget, expenses, map context, accommodation directions and saved places.

Trip calendar

- Tap any day to open its plan.
- Travel days can show train, flight and driving context.
- **Save itinerary as PDF** exports a portable copy of the itinerary.

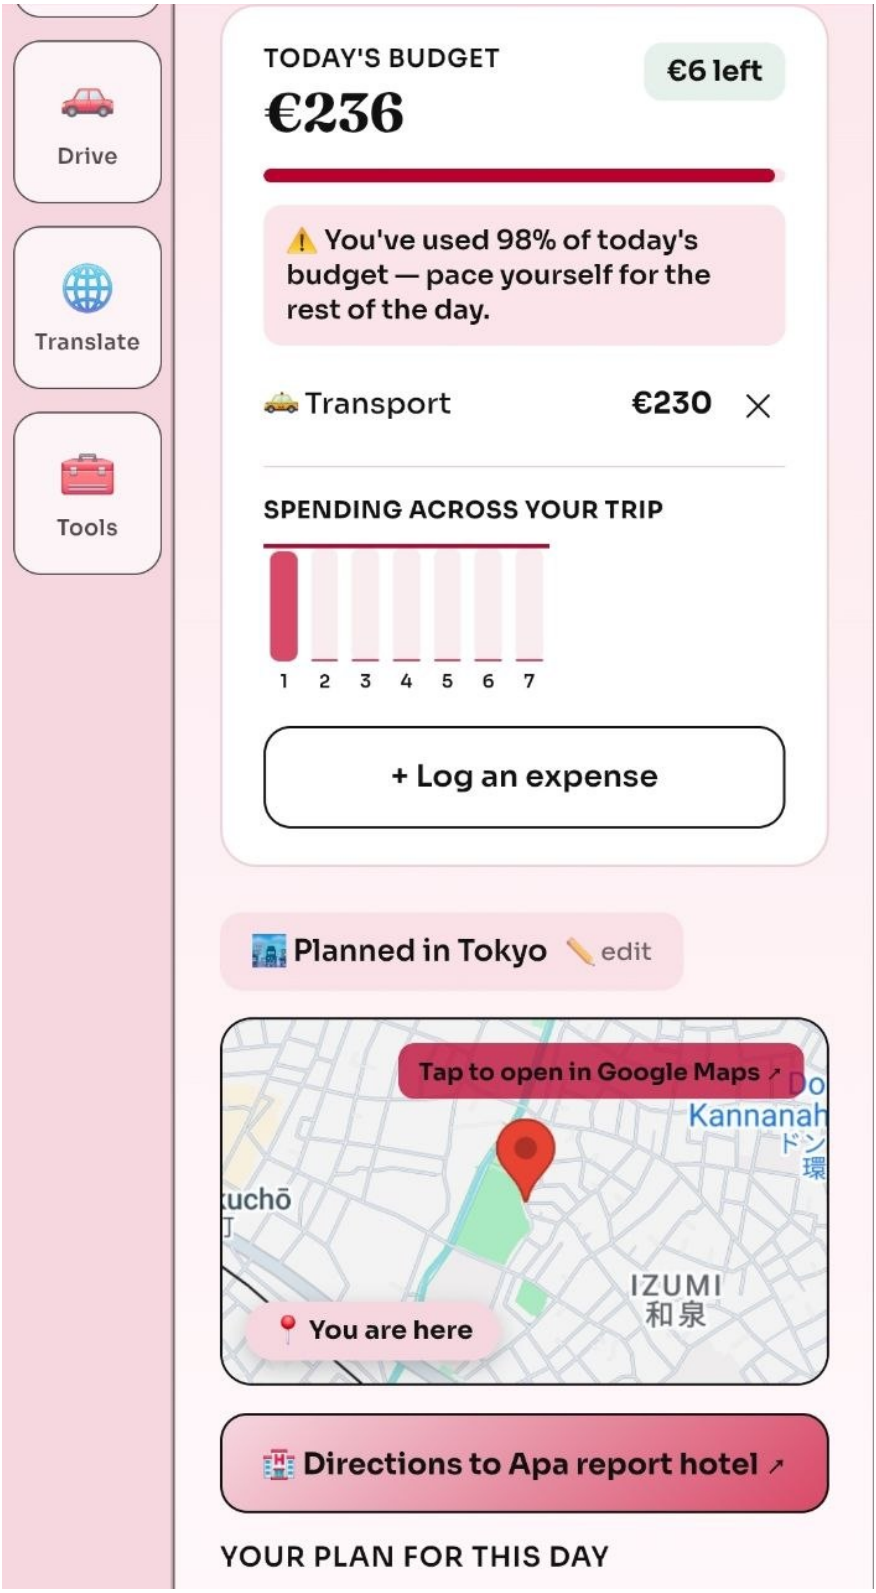

Itinerary calendar and planning-ahead view.

Daily budget and expenses

- **Today's budget:** original daily target.
- **Left:** remaining amount against that target.
- **Log an expense:** records real spending for the selected day.
- **Spending across your trip:** shows how daily spending is distributed.

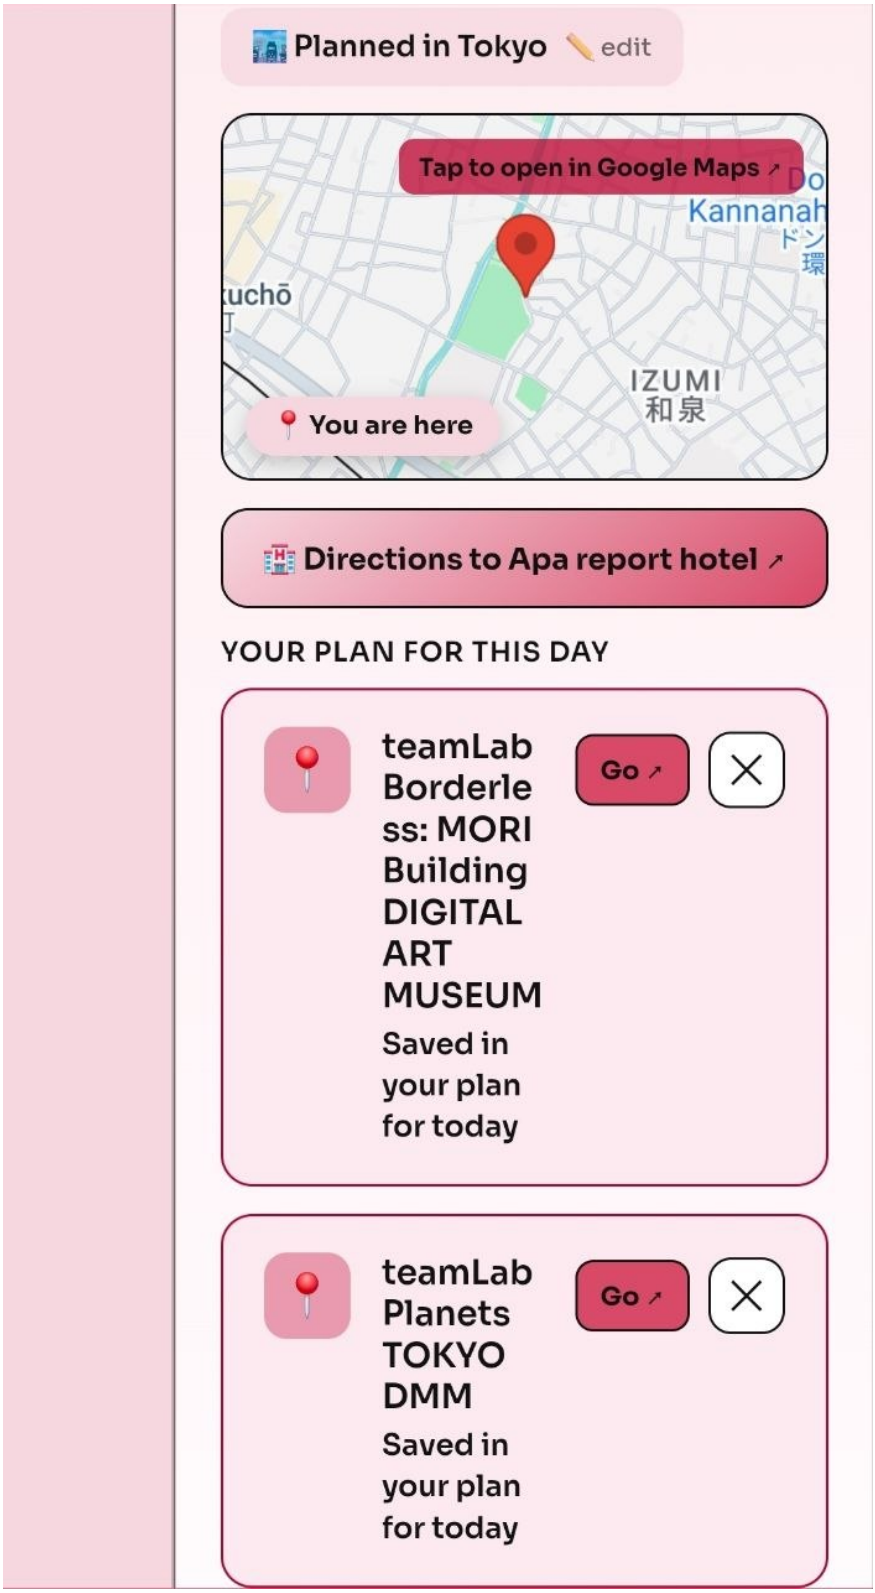

> **Shared budget source**
> Expenses entered in Itinerary are the source that Intelligent Day Budget reads. Avoid maintaining separate numbers in your head; log the real expense once in Itinerary.

Daily budget, expense logging and trip-spending chart.

Map, accommodation and daily plan

- The daily map provides quick location context and can open Google Maps.
- Accommodation directions use the saved stay information.
- Saved places appear under **Your plan for this day**.
- Use **Go** to navigate or the remove control to take a place out of the day.

Itinerary map, accommodation directions and saved daily places.

11. Nearby

Nearby finds useful places around the current location. It supports travel mode and category filters and can add results directly to the itinerary.

- **Travel mode:** On foot or By car.
- **Categories:** Food, Culture, Nature and other Japan-oriented groups.
- Cards can show name, rating, review count, address, open/closed status and provider price range.
- Tap **+ Add to itinerary** to save a place to the appropriate day.

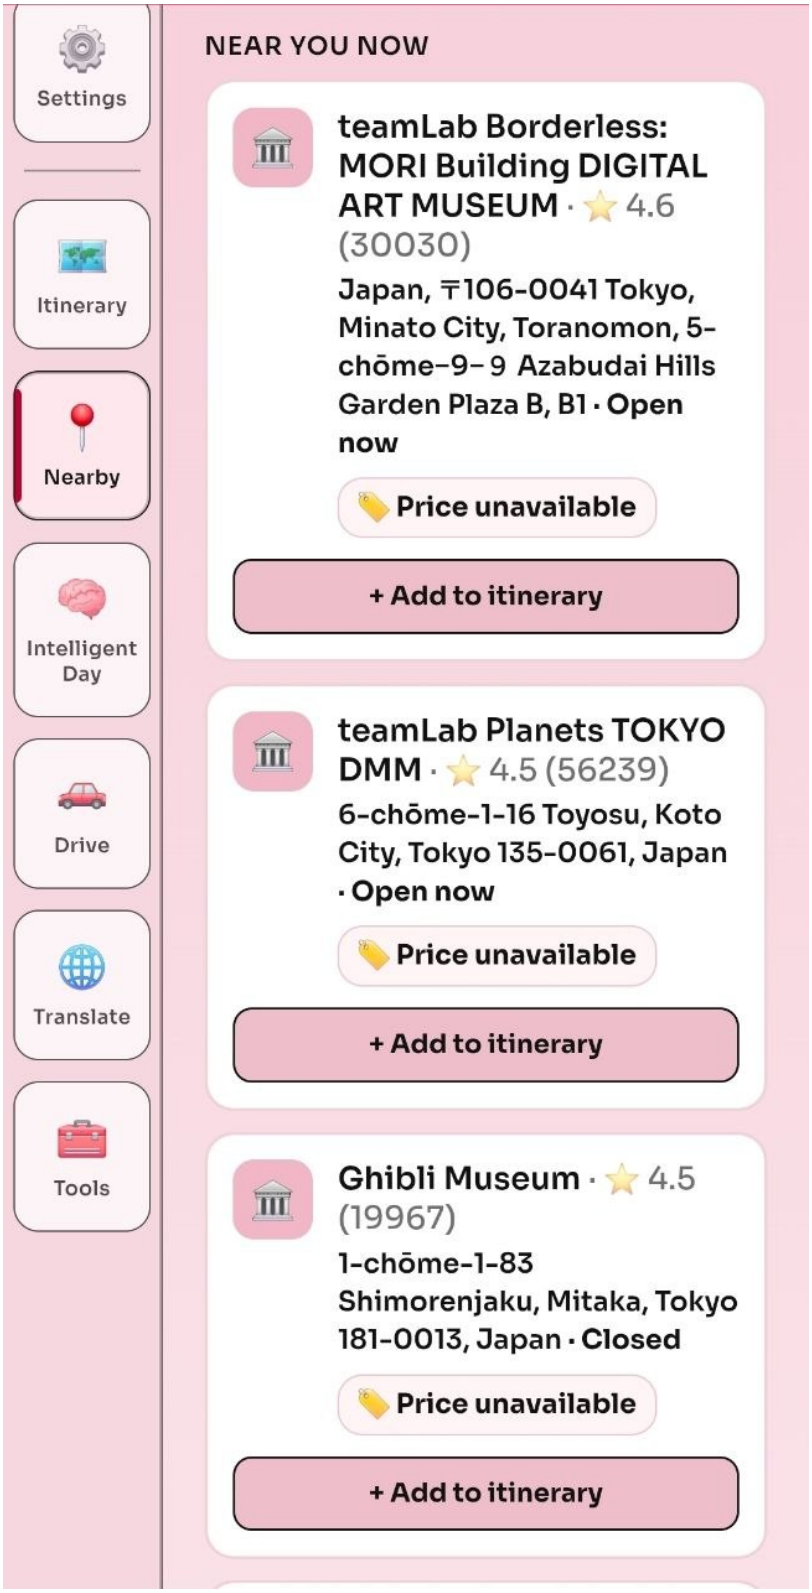

Nearby example with a real provider price range.

Price display rule

687 Japan must never guess a monetary price. A place affects exact budget logic only when the provider supplies a real monetary amount or range.

- If a provider price range exists, show it (for example, JPY 1000-2000).
- If no usable monetary price is supplied, show **Price unavailable**.
- **Price unavailable** does not mean free or cheap.

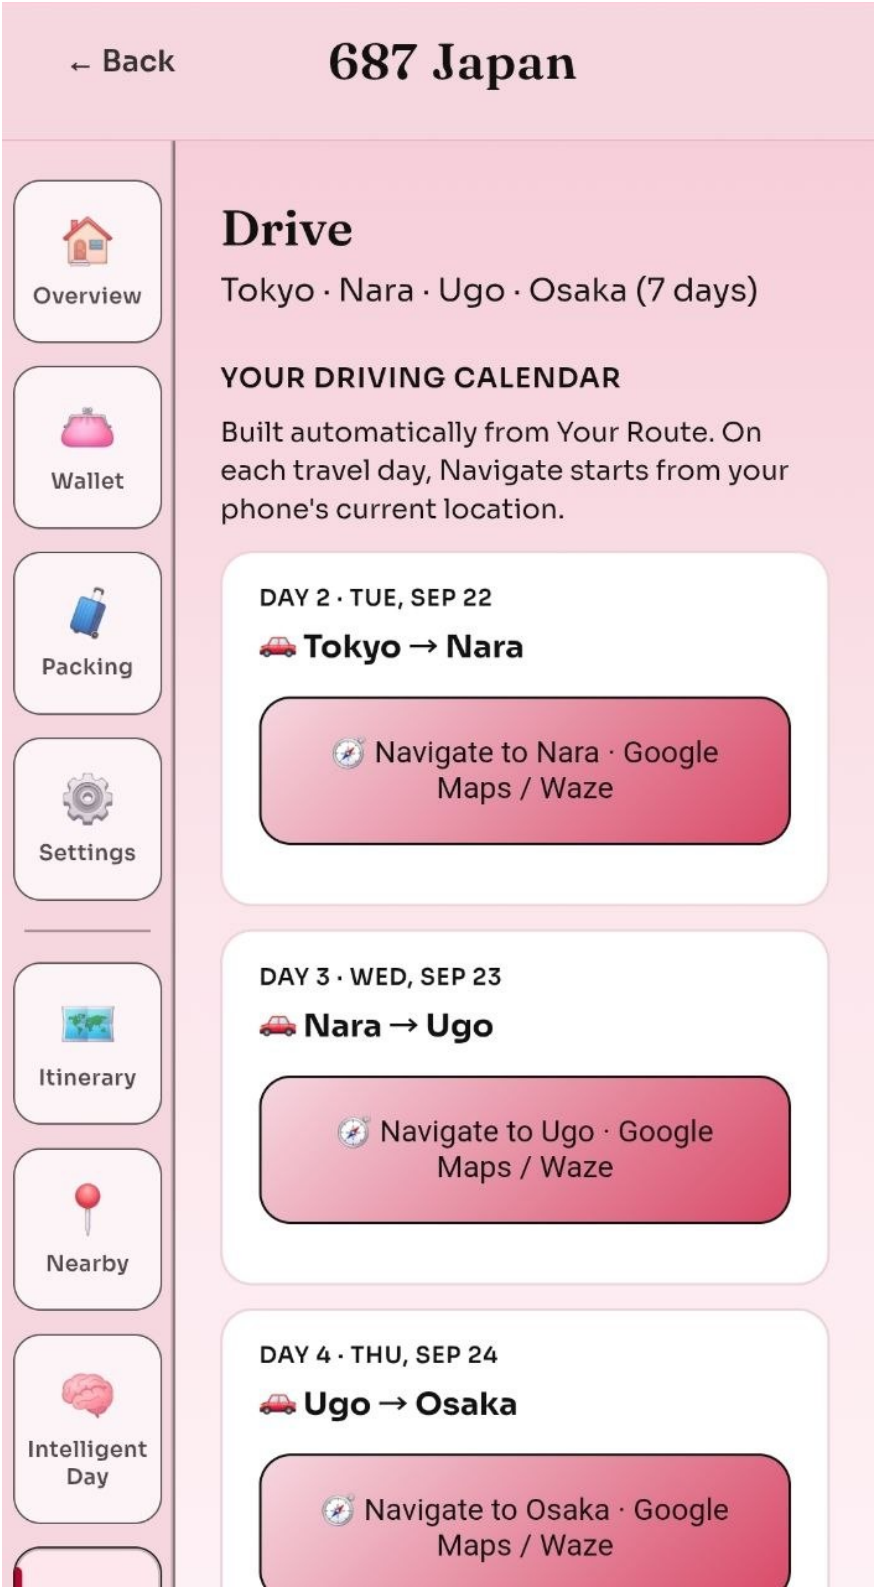

Nearby example where the provider does not supply a usable price.

12. Drive

Drive turns the multi-city route into a driving calendar for the relevant travel days. Navigation starts from the phone's current location toward the next city.

- Each card identifies the day and city-to-city transfer.
- Tap the navigation action to choose **Google Maps** or **Waze**.
- Use the external navigation app for live turn-by-turn routing, traffic and road instructions.

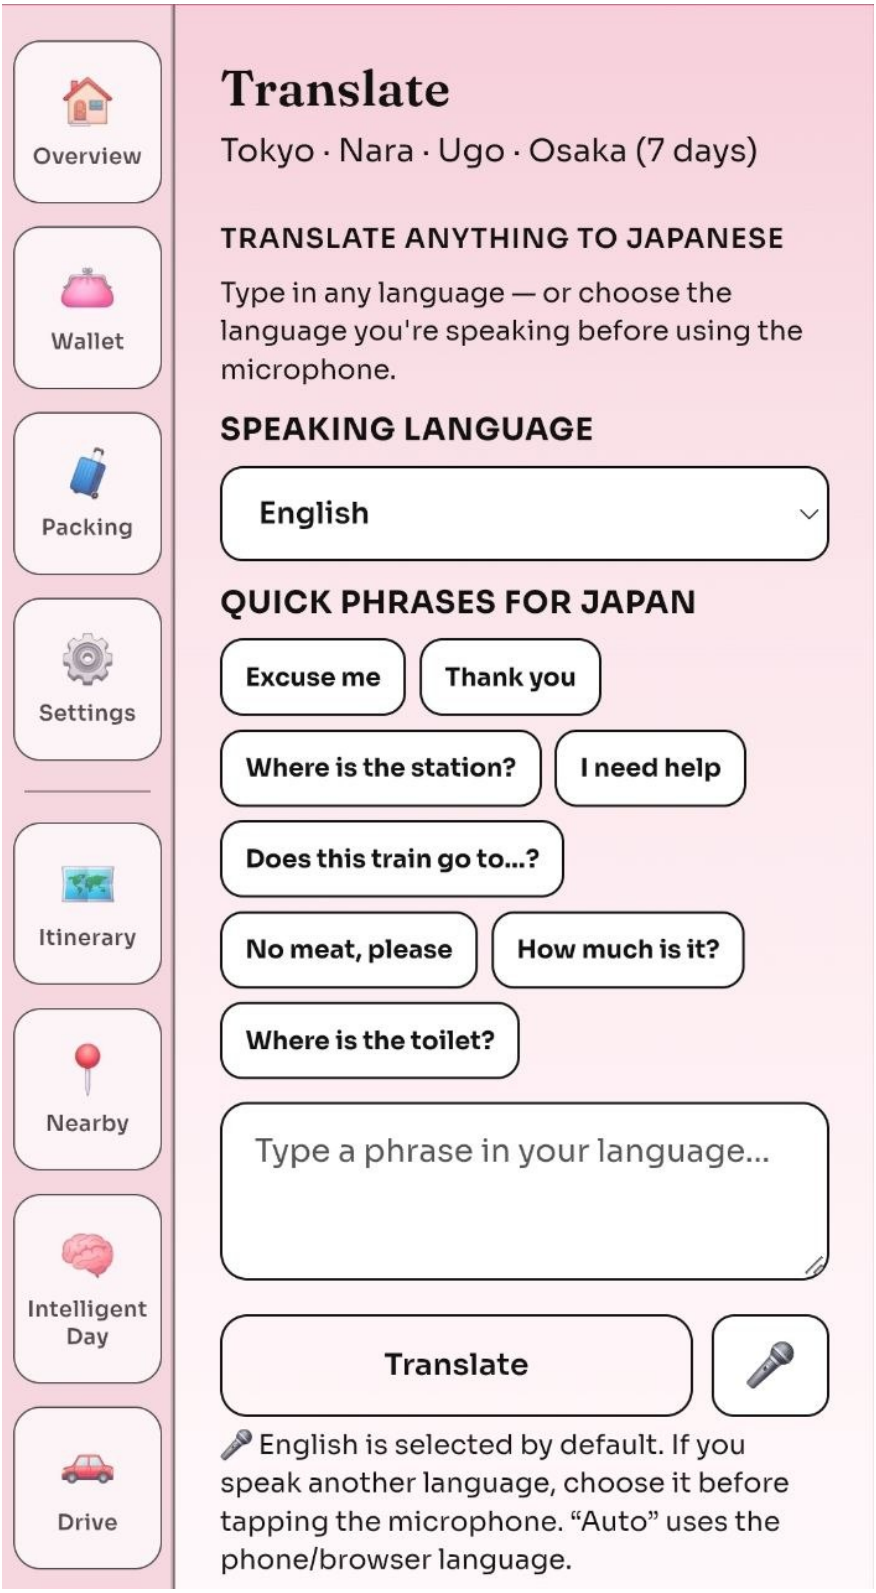

Drive calendar with Google Maps / Waze navigation.

13. Translate

Translate is designed for fast travel communication in Japan. Choose the language you are speaking, use a ready-made phrase, type text, or use the microphone.

- **Speaking language:** choose your input language.
- **Quick phrases:** common travel phrases such as station, help, toilet and food requests.
- **Text input:** type any phrase.
- **Microphone:** speak after selecting the correct input language.
- **Translate:** sends the phrase to the translation flow for Japanese output.

> **Tip**
> English is the default in the example build. If you speak another language, select it before using the microphone. Auto follows the device/browser language where supported.

Translate with speaking-language selector, quick phrases and microphone.

14. Tools

Tools contains practical Japan utilities, including a yen reference conversion and emergency numbers.

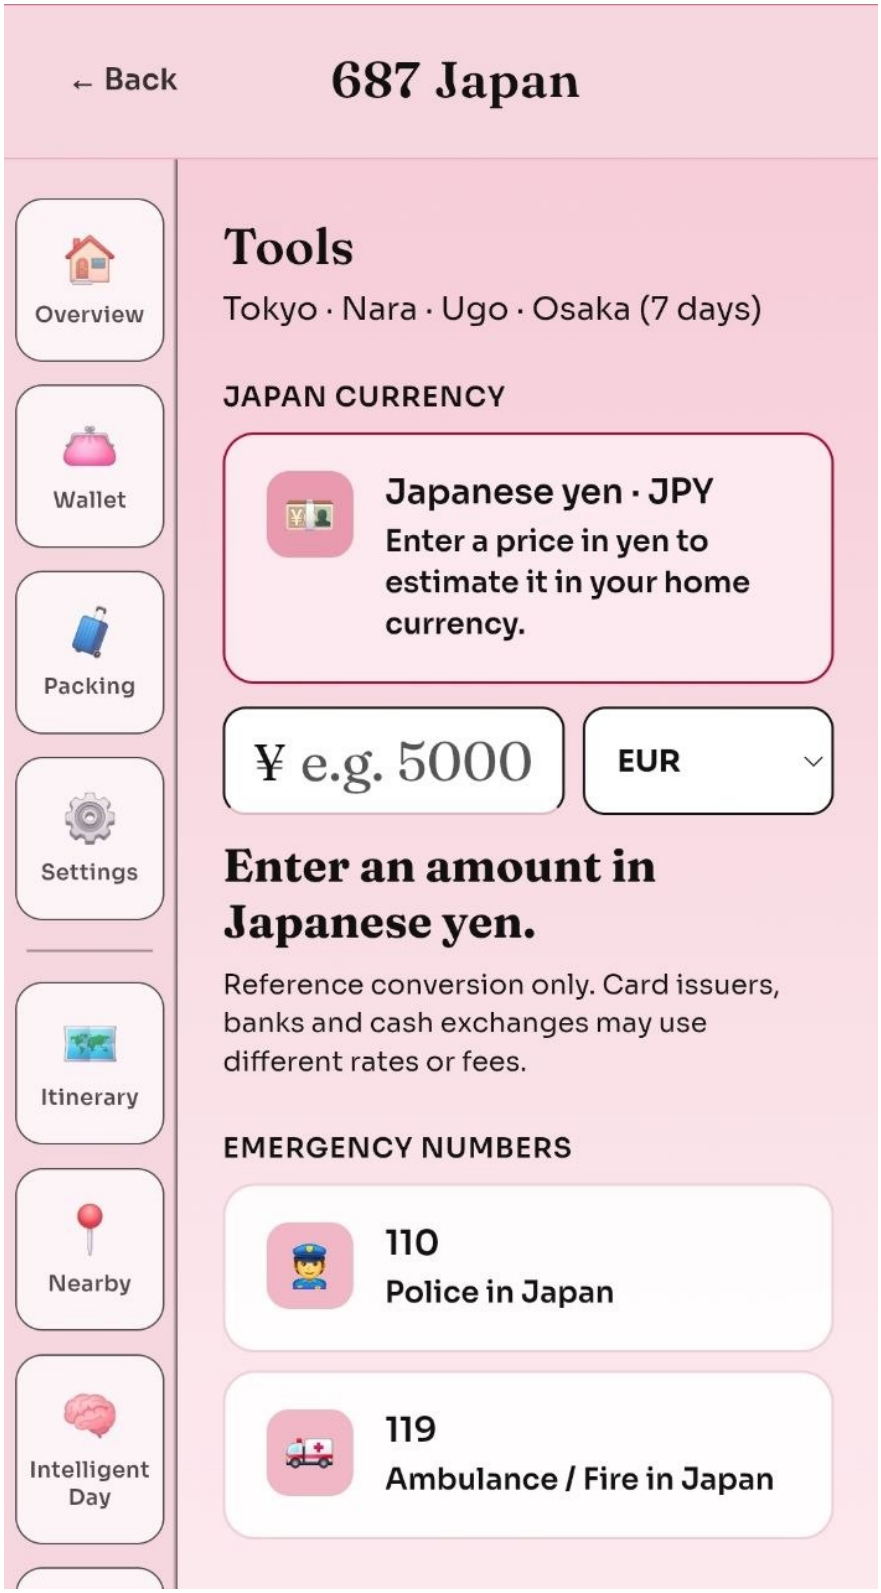

Japan currency

- Enter an amount in Japanese yen.
- Choose the target home currency.
- Use the result as a reference estimate, not a guaranteed bank or card settlement rate.

> **Exchange-rate notice**
> Card issuers, banks and cash exchanges may apply different rates, spreads or fees.

Emergency numbers

- **110** - Police in Japan
- **119** - Ambulance / Fire in Japan

Tools: Japanese yen reference conversion and emergency numbers.

15. Intelligent Day - how the seven screens work together

Intelligent Day is the live operating layer of 687 Japan. Each screen has a different job:

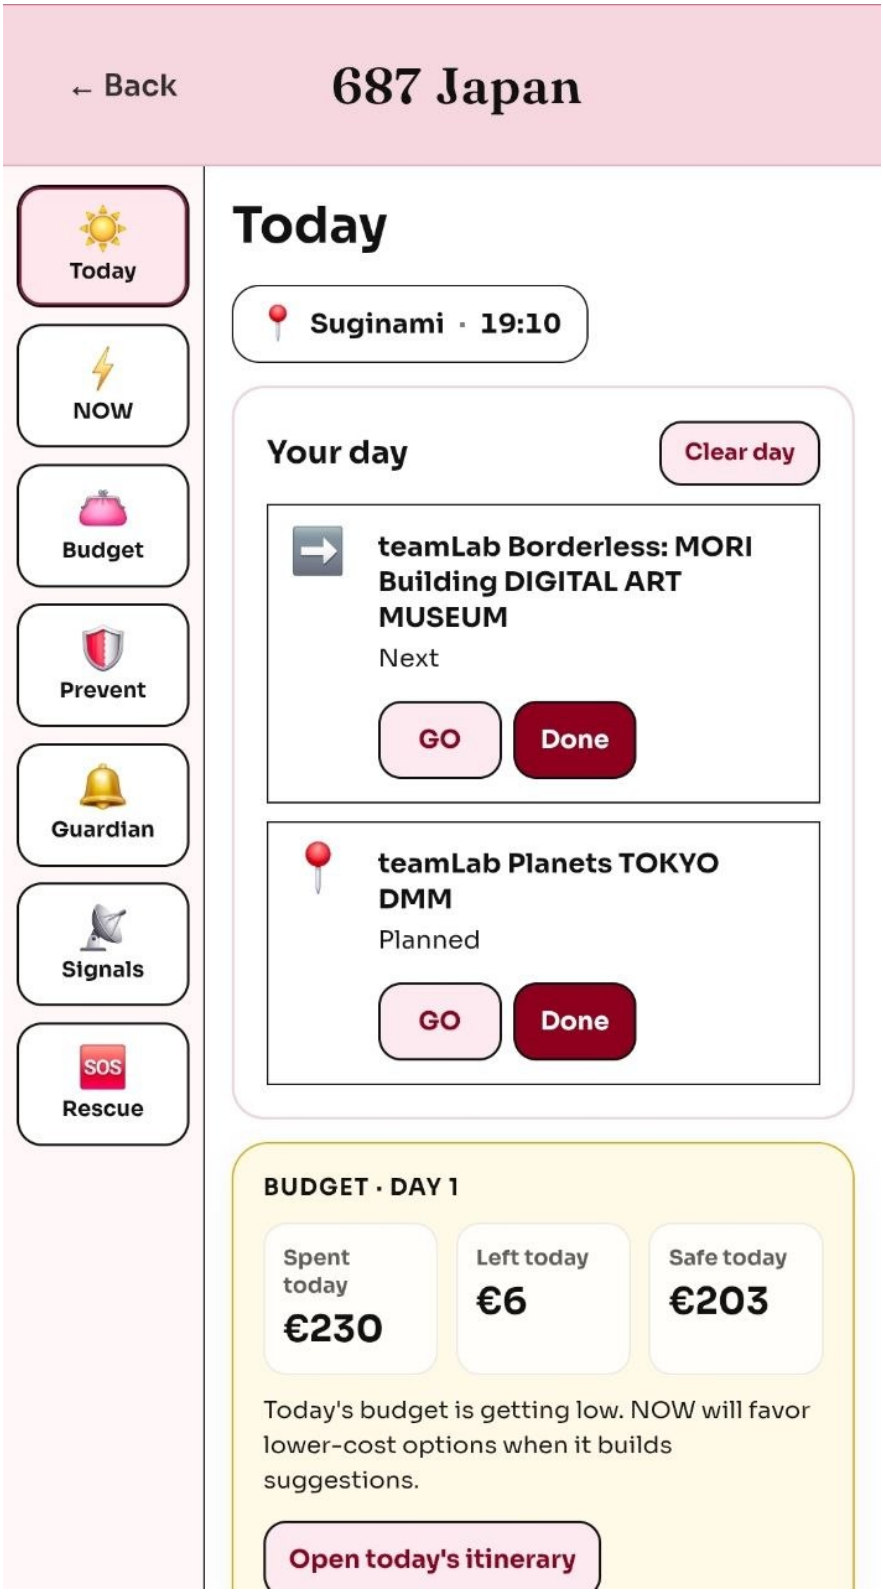

- **Today:** what is already planned for the current day.
- **NOW:** what makes sense right now.
- **Budget:** what is safe to spend today.
- **Prevent:** what may become a problem before it happens.
- **Guardian:** notifications for important changes.
- **Signals:** traveler reports connected to your stops and routes.
- **Rescue:** immediate help after something has gone wrong.

> **Easy mental model**
> Today = plan. NOW = action. Budget = money. Prevent = risk. Guardian = alerts. Signals = shared live reports. Rescue = recovery.

16. Today

Today shows the current day plan, current location/time and a quick budget summary.

- **GO:** navigate to the stop.
- **Done:** mark a stop completed.
- **Clear day:** clear the planned stops for the day.
- **Budget - Day N:** quick summary of Spent today, Left today and Safe today.
- **Open today's itinerary:** jump to the day expense/plan details.

Today: planned stops, completion controls and day budget summary.

17. NOW - live suggestions

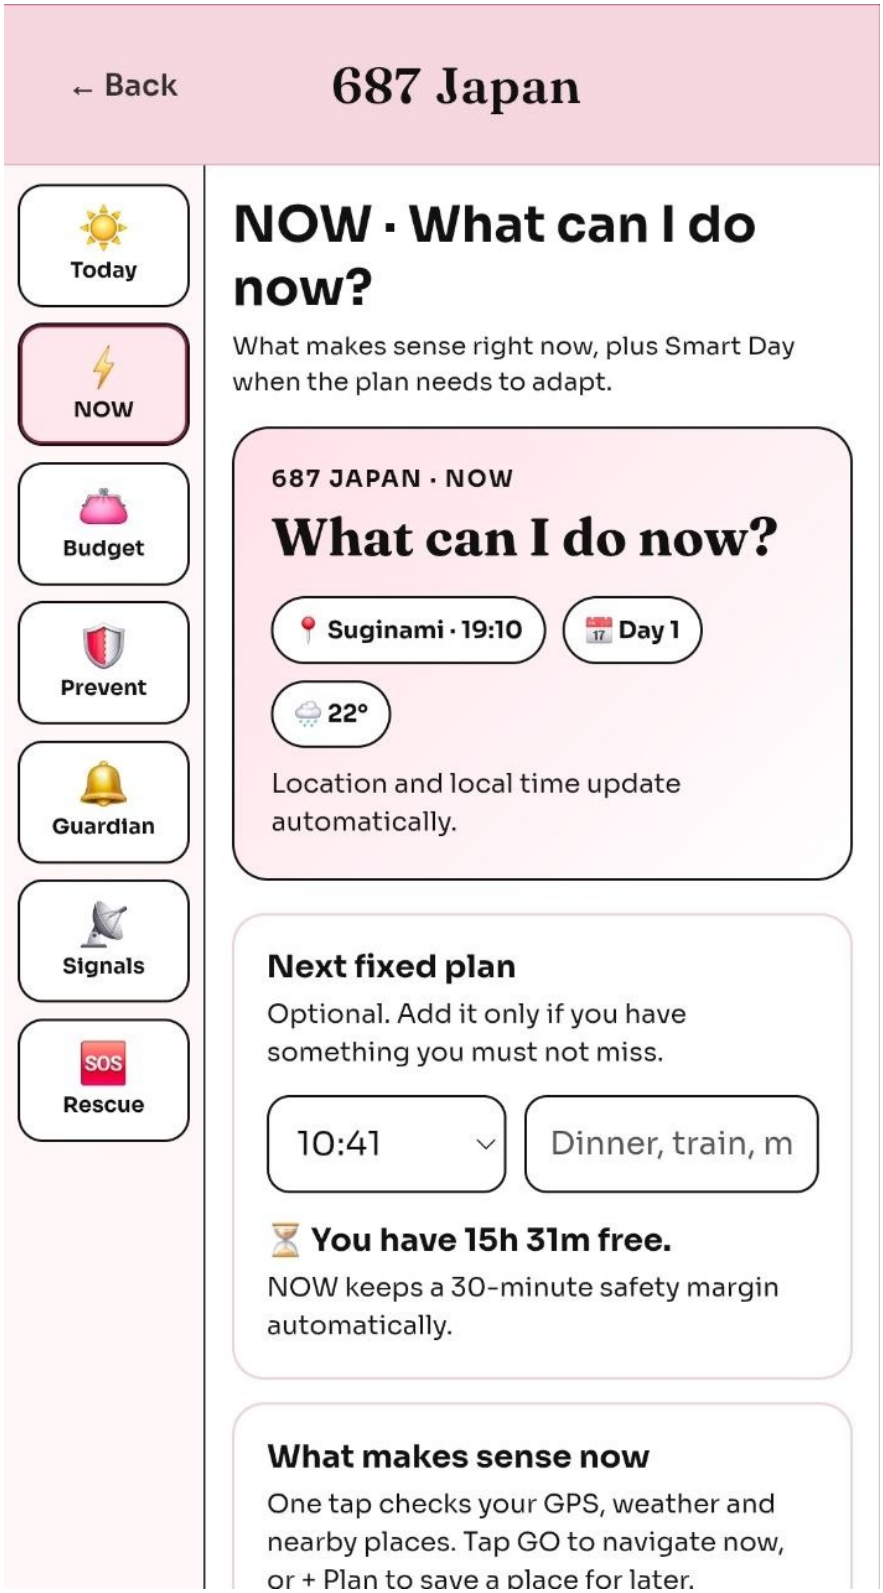

NOW combines current location, local time, weather, today's plan, available time and budget context.

Next fixed plan

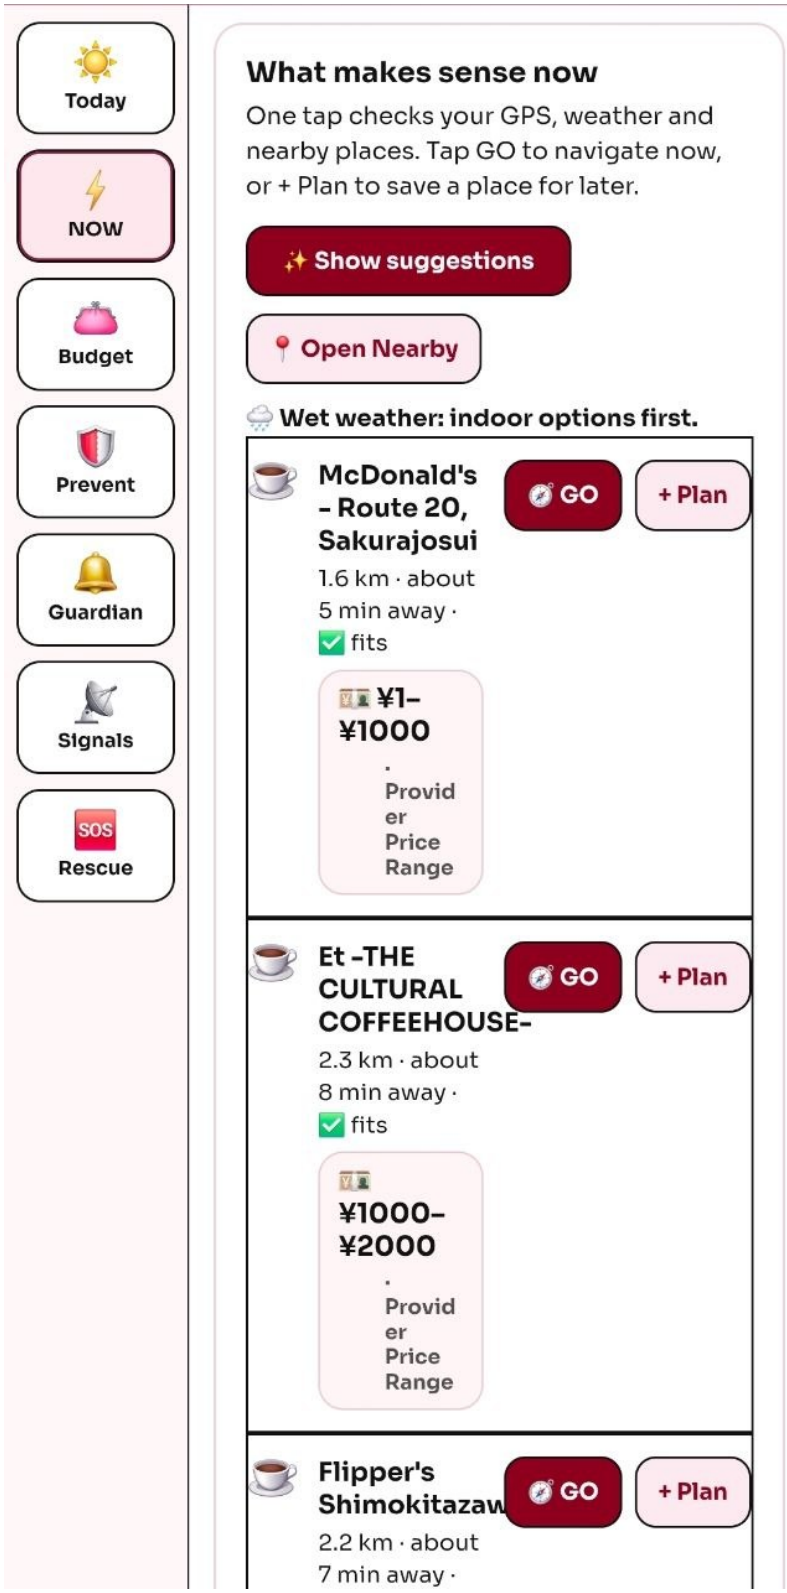

If you have a time-critical commitment later, enter the time and an optional label. NOW automatically keeps a 30-minute safety margin.

What makes sense now

- **Show suggestions:** check GPS, weather and nearby places.
- **Open Nearby:** browse Nearby directly.
- **GO:** navigate now.
- **+ Plan:** save a suggestion for later.

NOW header, current context and next fixed plan.

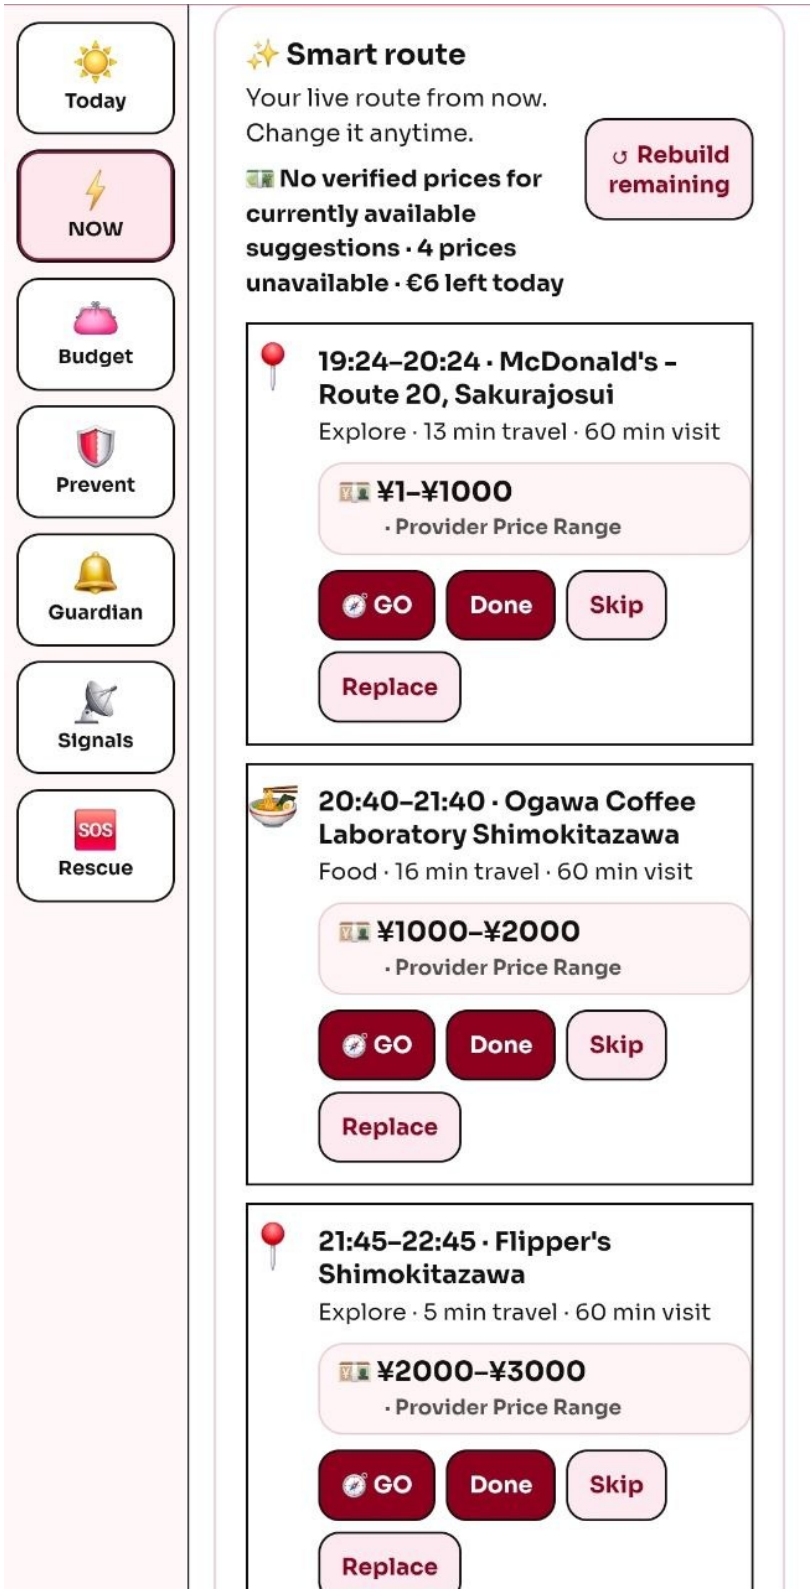

NOW suggestions using live context and provider price data.

18. Smart Route

Smart Route turns live suggestions into an ordered route. It is designed to adapt as time, weather, budget or completed stops change.

- Each stop can show a scheduled time window, category, travel estimate and visit estimate.
- **GO:** navigate to the stop.
- **Done:** mark it completed.
- **Skip:** skip the stop.
- **Replace:** replace the stop.
- **Rebuild remaining:** rebuild only the unfinished part of the route.

Price awareness
Smart Route can use verified monetary prices when present. When no available suggestion has a verified price, the app explicitly says so rather than guessing.

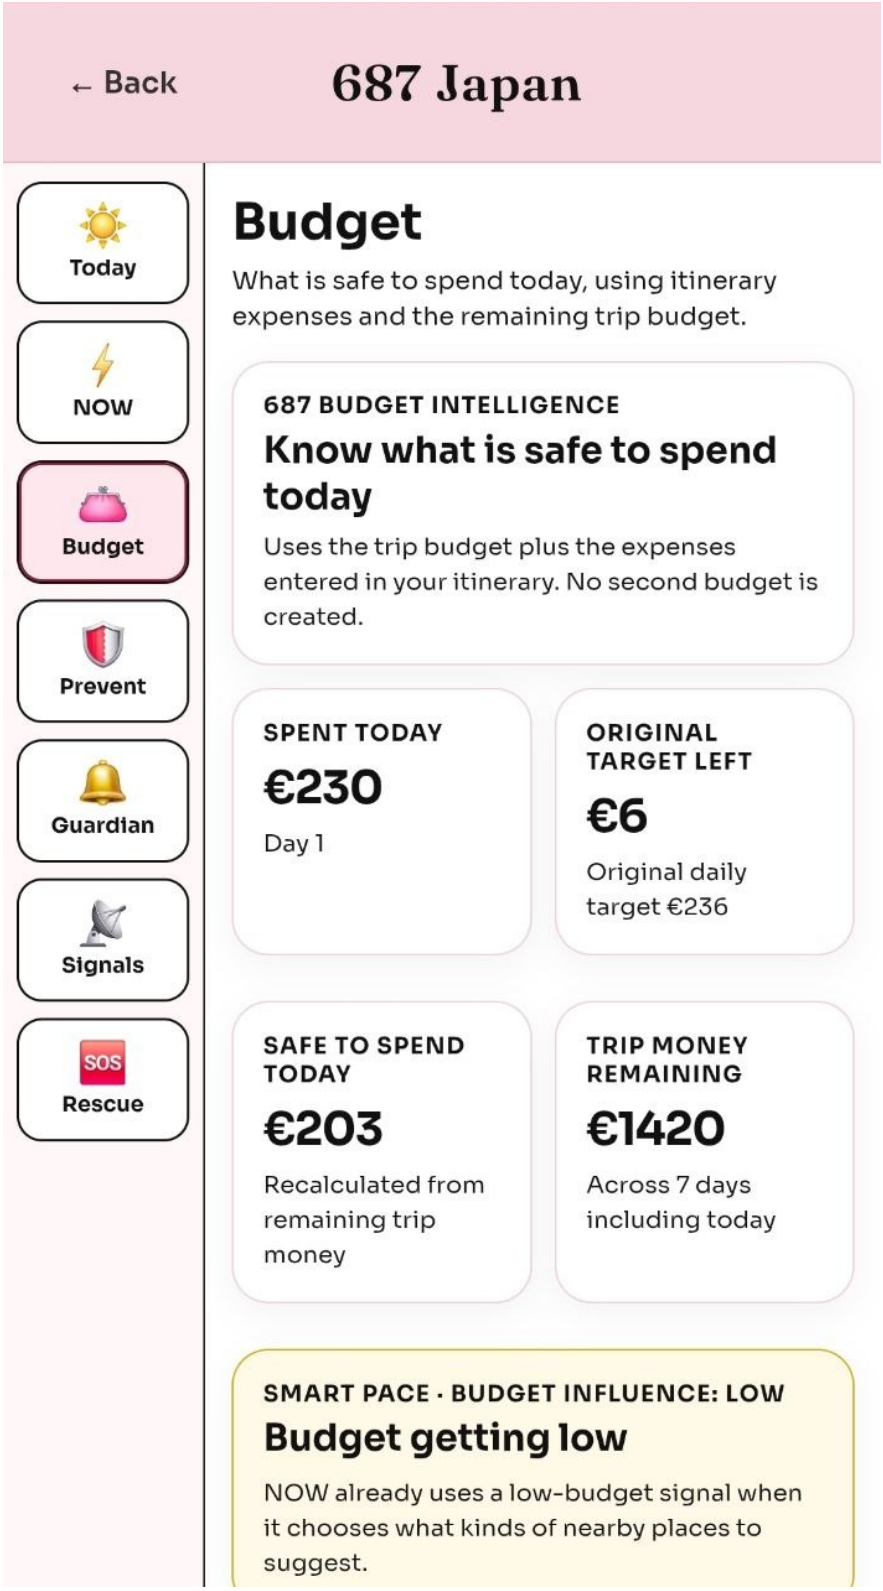

Smart Route with live schedule, actions and verified-price messaging.

19. Intelligent Day Budget

This screen answers a different question from the original daily target: **What is safe to spend today, given what has already happened and what remains across the trip?**

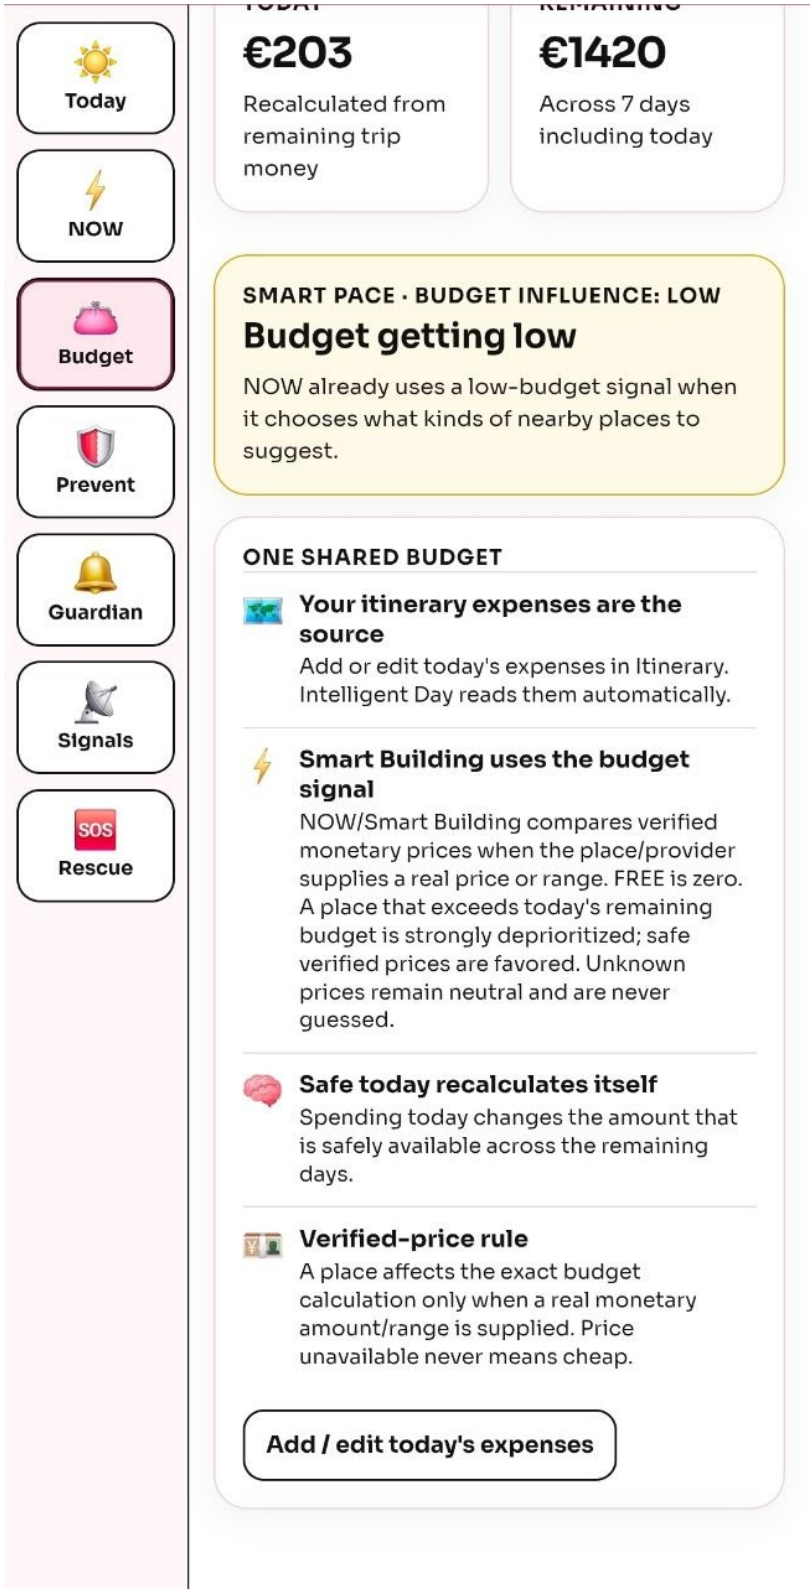

- **Spent today:** expenses logged for the current day.
- **Original target left:** what remains from the original day target.
- **Safe to spend today:** recalculated amount based on remaining trip money.
- **Trip money remaining:** money still available across the rest of the trip.
- **Budget influence:** NORMAL, LOW or OVER.

Budget Intelligence: daily spending, safe-to-spend and trip money remaining.

How budget influences Smart Building

- Itinerary expenses are the single source for day spending.
- LOW budget makes NOW favor lower-cost choices.
- A place that exceeds the safe remaining amount is strongly deprioritized when a verified price is available.
- Unknown prices stay neutral and are never guessed.
- **Add / edit today's expenses** returns you to the source data.

Budget rules shared between Itinerary and Intelligent Day.

20. Prevent

Prevent checks today's plan against weather and active traveler reports before they become a problem.

Status

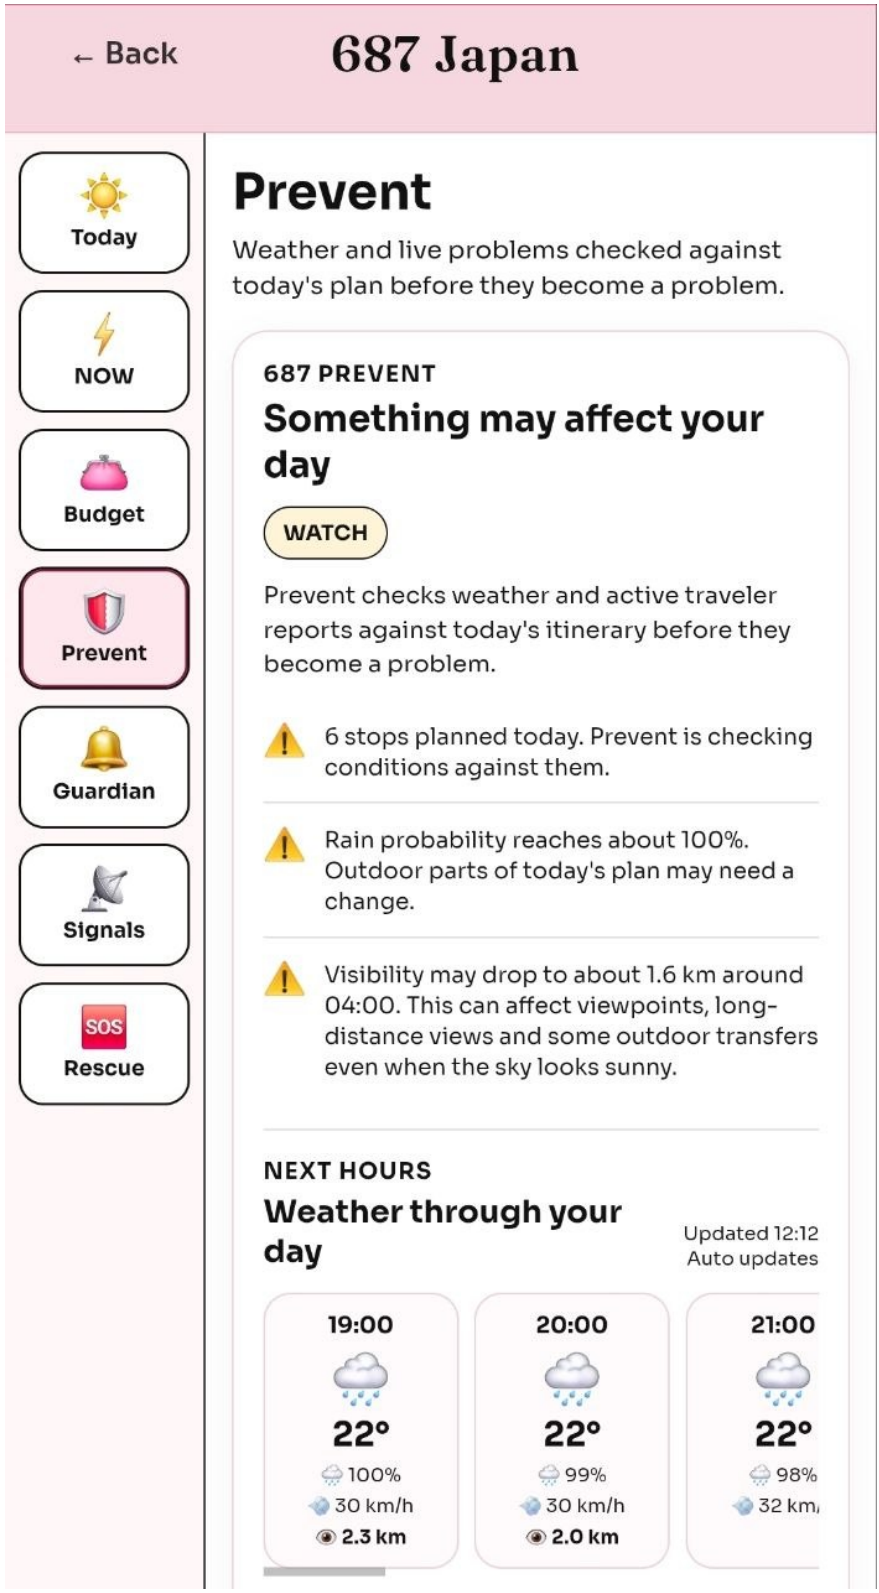

- **GOOD:** no meaningful issue detected.
- **WATCH:** conditions deserve attention.
- **CHANGE:** the day may need a material adjustment.

Weather through your day

The hourly timeline can show temperature, rain probability, wind and visibility. Visibility warnings include both distance and time when the data supports it.

Fix in NOW

When action is useful, **Fix in NOW** opens NOW so the remaining plan can be adapted.

Prevent example with WATCH status and hourly weather risk.

21. Guardian

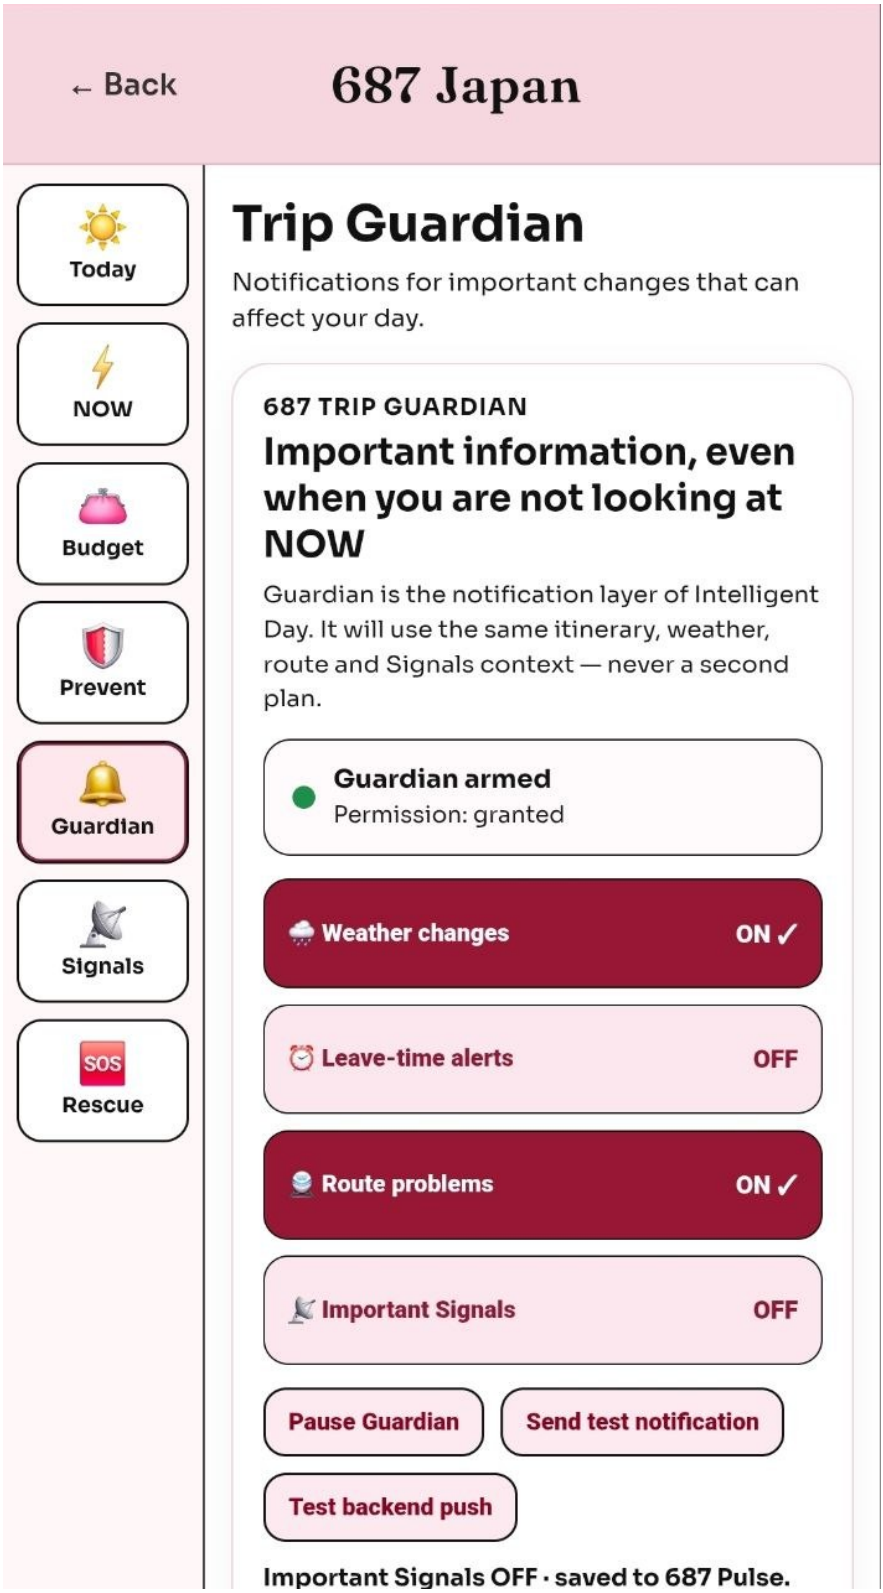

Guardian is the notification layer of Intelligent Day. It uses the same itinerary, weather, route and Signals context - it does not create a second plan.

- **Weather changes**
- **Leave-time alerts**
- **Route problems**
- **Important Signals**

Controls

- **Pause Guardian:** pause the notification layer.
- **Send test notification:** verify notification delivery on the device.
- **Test backend push:** verify backend push behavior when available.

Permissions
Guardian depends on notification permission. If permission is denied or restricted by the operating system, alerts may not appear as expected.

Trip Guardian armed with notification categories and test controls.

22. Live Signals and 687 Pulse

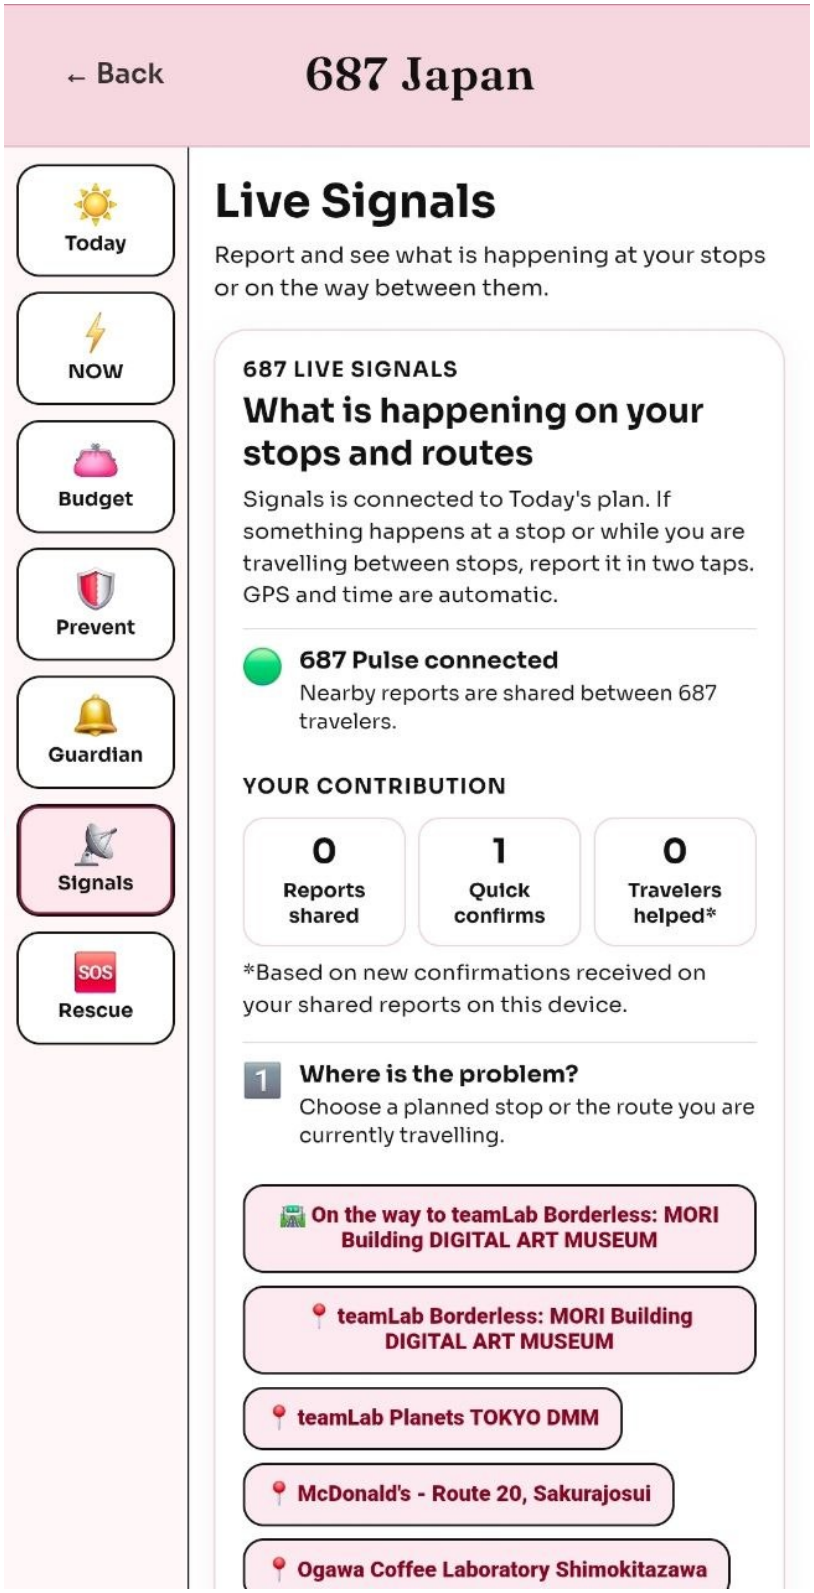

Signals lets travelers report what is happening at planned stops or on the route between them. GPS and time are automatic for the report context.

Your contribution

- **Reports shared:** reports created from this device.
- **Quick confirms:** confirmations you have made on other reports.
- **Travelers helped:** conservative count based on new confirmations received on reports created by this device.

Create a signal

- Step 1: choose where the problem is - a planned stop or a current route segment.
- Step 2: choose what happened.
- The report is shared anonymously when the 687 Pulse backend is reachable; local storage can remain as a fallback.

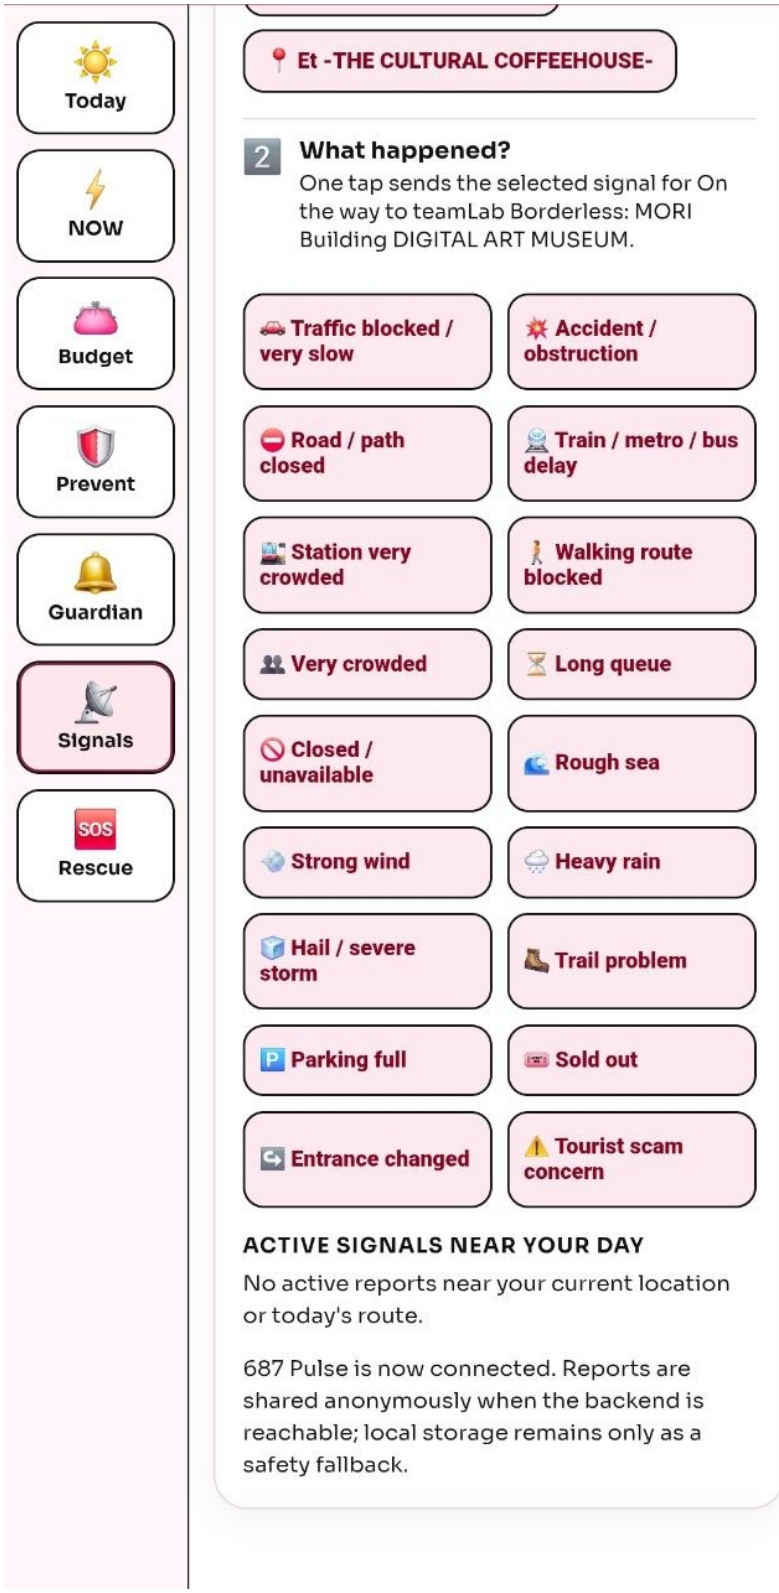

Live Signals: Pulse connection, contribution panel and location selection.

Signal categories

- Traffic blocked / very slow
- Accident / obstruction
- Road / path closed
- Train / metro / bus delay
- Station very crowded
- Walking route blocked
- Very crowded
- Long queue
- Closed / unavailable
- Rough sea
- Strong wind
- Heavy rain
- Hail / severe storm
- Trail problem
- Parking full
- Sold out
- Entrance changed
- Tourist scam concern

Active signals near your day

Relevant active reports appear when they match your current location, planned stops or route. Quick Confirm and Gone actions may be available on other travelers' reports according to the live report state.

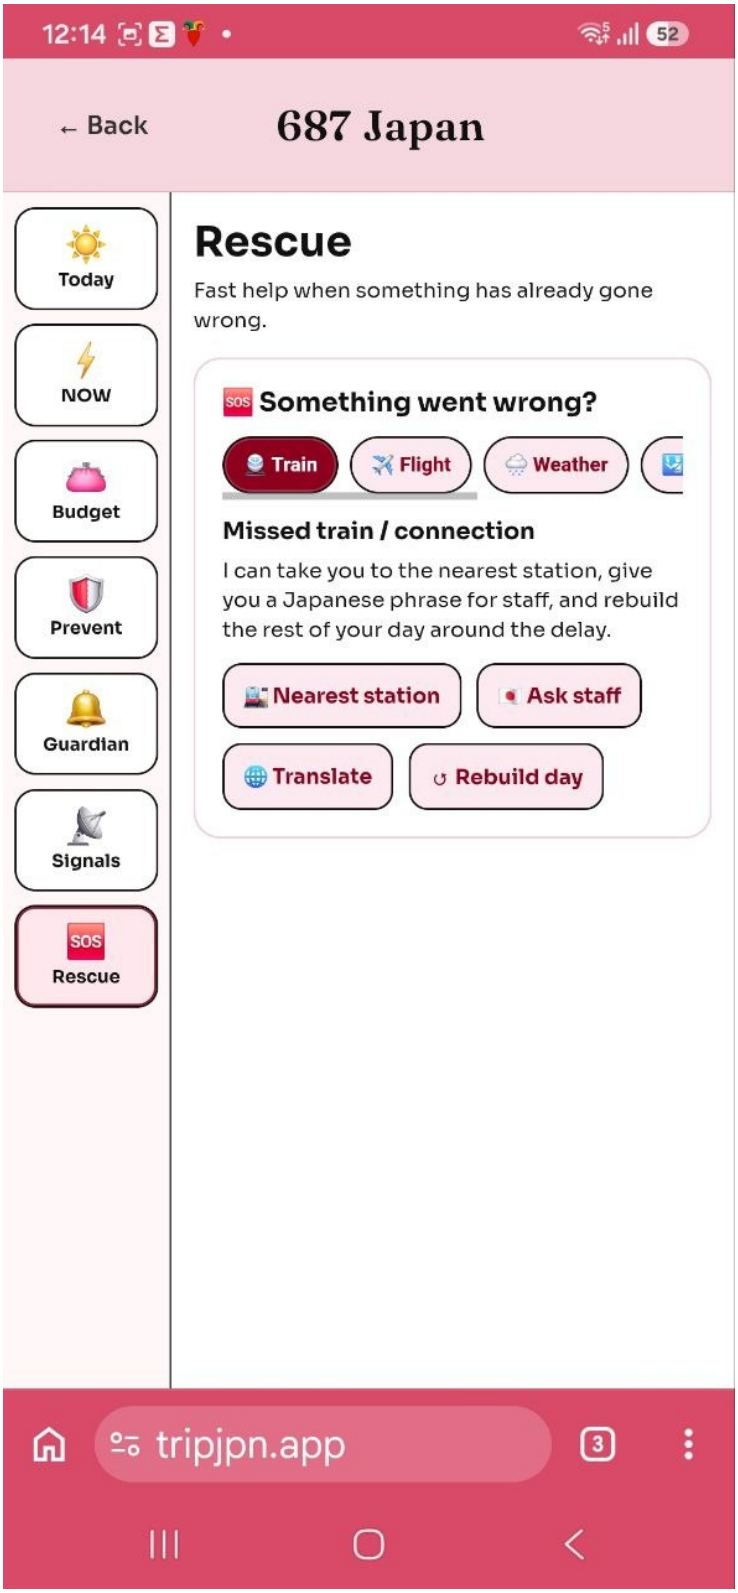

Signals: report categories and active-report area.

23. Rescue

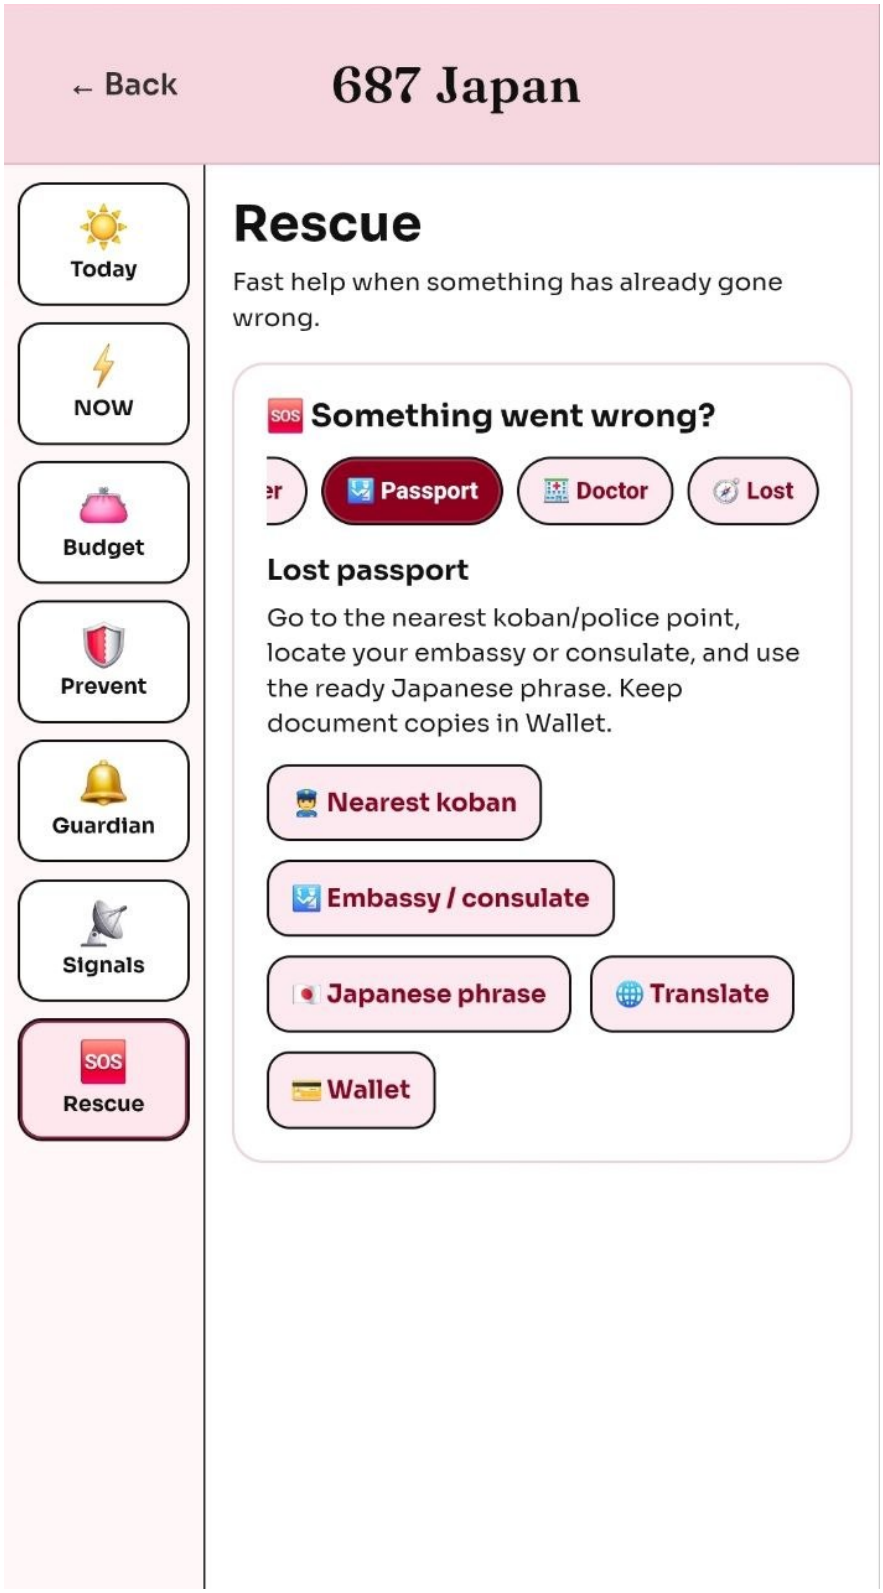

Rescue is for situations where the problem has already happened. It prioritizes immediate actions instead of long explanations.

Common rescue areas

- **Train:** missed train or connection.
- **Flight:** flight disruption.
- **Weather:** weather has already disrupted the plan.
- **Passport:** lost passport.
- **Doctor:** medical help or pharmacy.
- **Lost:** lost or unsure where to go.

Rescue - missed train/connection actions.

Rescue - lost passport actions, including koban, embassy, translation and Wallet.

24. Navigation rules

Whenever the app offers active navigation, follow the external navigation app for the final live route.

- **Google Maps:** supported for map and navigation handoff.
- **Waze:** offered alongside Google Maps for driving/navigation flows where applicable.
- GO actions in the day plan and Smart Route are shortcuts into real navigation.
- Drive city-to-city navigation must offer both Google Maps and Waze.

> **Safety**
> Do not interact with the app while driving. Set the destination before moving or let a passenger operate the phone.

25. Price and budget logic - read this carefully

Price data is deliberately conservative. The app distinguishes between a verified monetary price and the absence of price data.

- **Verified provider price/range:** may influence exact budget decisions.
- **Price unavailable:** no usable monetary price was supplied.
- **FREE:** only treat a place as zero-cost when the data explicitly supports it.
- Unknown price is neutral; it is not treated as free, cheap or expensive.
- Budget status can move between NORMAL, LOW and OVER as real expenses are logged.

Why this matters
A travel assistant should not create fake certainty. When price data is missing, 687 Japan says so and keeps the budget logic conservative.

26. Permissions and live features

Some features depend on device/browser permissions.

- **Location:** needed for Nearby, NOW, live location/time, route context and some Rescue actions.
- **Microphone:** needed for voice input in Translate.
- **Notifications:** needed for Guardian alerts.
- **Internet:** live weather, external providers, maps, translation and 687 Pulse need connectivity.

If a live feature fails

- Check that the site/app has the required permission.
- Check internet connectivity.
- Retry after reopening the relevant screen.
- For external providers, remember that their pages and availability are outside 687 Japan.

27. Emergency use

Use Rescue for fast in-app help, but use official emergency services when immediate safety or health is at risk.

Japan emergency numbers
110 - Police
119 - Ambulance / Fire

Practical sequence in a serious situation

- Move to a safe place if possible.
- Call the appropriate official emergency number when needed.
- Use Translate or Rescue phrases to communicate.
- Use Wallet for saved booking details and travel confirmations.
- Use Maps/Waze only when it is safe to do so.

28. Recommended daily workflow

A simple routine helps you get the most value from the app.

Before leaving in the morning

- Open **Today**.
- Check **Budget**.
- Open **Prevent**.
- Confirm **Guardian** is armed if you want alerts.

During the day

- Use **NOW** when you need the next useful action.
- Use **Nearby** when you want to browse manually.
- Mark finished stops **Done**.
- Log real expenses in **Itinerary**.

When something changes

- Use **Fix in NOW** from Prevent.
- Use **Rebuild remaining** in Smart Route.
- Check **Signals** for nearby shared reports.

When something goes wrong

Open **Rescue** and follow the action buttons for the relevant problem.

29. Troubleshooting

Location does not update

- Check Location permission for the app/site.
- Turn device location services on.
- Reload the relevant live screen.

Microphone does not work

- Check microphone permission.
- Select the correct speaking language before tapping the microphone.
- Retry on the real app/domain rather than a local downloaded HTML file.

No price is shown

If the provider supplies no usable monetary value, **Price unavailable** is the correct result.

Guardian does not notify

- Check notification permission.
- Verify the relevant Guardian toggle is ON.
- Use Send test notification to test the device.

External booking page opens differently

External providers can change their web pages, supported URL parameters or app behavior. Verify dates/travelers on the provider page before completing any booking.

30. Final pre-publication checks for this guide

The guide is complete enough for normal use, but the following screenshots or checks would make the documentation fully closed and visually demonstrative:

- **Currency conversion result:** a screenshot showing a successful JPY -> EUR/USD conversion after entering an amount.
- **Google Maps / Waze chooser:** a screenshot of the actual chooser after tapping a Drive navigation action.
- **Itinerary PDF export:** one confirmation/screenshot showing the exported itinerary PDF.
- **Guardian notification:** one screenshot of a real test notification on the phone (optional but useful).
- **Wallet document flow:** a screenshot after adding a voucher/confirmation if document upload is intended for production.
- **Additional Rescue tabs:** Flight, Weather, Doctor and Lost can be documented with screenshots if you want every rescue case visually represented.

Current guide status
All major screens and workflows are documented. The missing items above are documentation completeness items, not evidence that the core app is incomplete.

31. Quick reference

- **Overview:** trip budget at a glance.
- **Wallet:** booking details and travel documents.
- **Packing:** preparation checklist.
- **Itinerary:** calendar, daily expenses, map and plan.
- **Nearby:** places around you.
- **Drive:** city-to-city driving calendar.
- **Translate:** Japanese translation and quick phrases.
- **Tools:** yen conversion and emergency numbers.
- **Today:** what is planned now.
- **NOW:** what makes sense right now.
- **Budget:** what is safe to spend.
- **Prevent:** what may affect the day.
- **Guardian:** important notifications.
- **Signals:** shared live traveler reports.
- **Rescue:** fast help after a problem.

Remember
The strongest results come from keeping your itinerary and real expenses up to date. That gives NOW, Budget and Prevent the best available context.

NEW IN 1.2

32. What's new in version 1.2

Version 1.2 adds four practical upgrades for real situations in Japan: places, restaurants, conversations and long-distance travel.

Apple Maps place card: official place details inside Nearby (iPhone with iOS 18 or later).

English menu helper: find restaurants more likely to have an English menu and ask staff in Japanese.

Conversation mode: two-way spoken translation in Translate.

New train and flight cards: correct Shinkansen stations, travel time and ticket search.

Good to know

All new features use the same trip, itinerary and budget. Nothing creates a second plan.

NEW IN 1.2

Apple Maps place card

On iPhone with iOS 18 or later, tapping a place in Nearby opens the official Apple Maps place card directly inside 687 Japan.

What you see: photos, opening hours, address, phone, website and other details provided by Apple Maps.

No app switching: you stay inside 687 Japan and go back to your results with one tap.

Then act: use GO to navigate or + Plan to save the place into today's itinerary.

Note

On older iOS versions and on Android, Nearby shows the standard 687 place details.

NEW IN 1.2

English menu helper

In Nearby food search, 687 Japan puts first the restaurants that are more likely to welcome foreign guests, for example places with English names or English websites.

Ready phrase: the app shows the Japanese question: 英語のメニューはありますか？ (Do you have an English menu?).

Listen: tap the speaker and the phone reads the sentence aloud in Japanese.

Show to staff: open the full-screen view and show the phone to the waiter.

Honest note

Maps do not mark English menus, so this is a helpful priority, not a guarantee. The phrase always works.

NEW IN 1.2

Conversation mode

Translate now has a Conversation mode for talking with someone face to face.

How it works: you speak in your language, the other person hears Japanese; they answer in Japanese and you read and hear the reply in your language.

Take turns: speak one at a time and keep the phone between you, so both people can see and hear each reply.

Best results: speak in short sentences, in a quiet place, and choose your language correctly before you start.

Tip

Use the normal Translate screen for single phrases; use Conversation for a real exchange (hotel desk, shop, station).

NEW IN 1.2

Trains: Shinkansen card

On a city-transfer day, the train card now shows the right information for Japanese long-distance trains.

Correct station: the Shinkansen station is shown, for example Shin-Osaka instead of Osaka.

Travel time: approximate time between stations on the same line.

Public transport route: open the route in Apple Maps public transport.

Tickets: search train tickets with 12Go, with date and travelers already filled in.

Tip

Check the departure station on your ticket: many big cities have more than one main station.

NEW IN 1.2

Domestic flights card

The flight card for transfers inside Japan has been redesigned.

Right airports: Tokyo and Osaka are searched across all their airports, so you see every option.

Flight search: open a flight search with dates already filled in.

Shinkansen vs flight: a quick comparison helps you see when the train is simply faster door to door.

Alternative: search the same trip with 12Go too.

Remember

After booking, enter the price in the trip so your budget stays correct.
